**TITLE: MATERIALS AND METHODS FOR
IMMUNOCONTRACEPTION**

5 CROSS REFERENCE TO RELATED APPLICATION

This application is a continuation-in-part of U.S. Application Serial No. 08/012,990, filed January 29, 1993, which is a continuation-in-part of U.S. Application Serial No. 07/973,341, filed on November 9, 1992.

FIELD OF THE INVENTION

10 This invention relates generally to the production and use of zona pellucida proteins, and more particularly to novel DNA sequences encoding zona pellucida proteins, to recombinant materials and methods for producing such proteins and to materials and methods for selectively effecting either transient infertility or permanent sterility in mammals through use of
15 naturally occurring and recombinant zona pellucida proteins.

BACKGROUND OF THE INVENTION

The present invention relates to a method for inducing reproducible transient infertility or sterility in a mammal by inducing in that mammal antibodies directed to proteins found in the zona pellucida of that
20 mammal's oocytes. The invention also relates to purified, isolated DNA sequences encoding the zona pellucida proteins herein designated "ZPA" and "ZPB" and "ZPC" from various mammalian species. The invention is further directed to pharmaceutical compositions capable of inducing antibody production in a subject mammal.

- 2 -

The zona pellucida (ZP) is a complex matrix surrounding the mammalian oocyte, formed of glycoproteins secreted by ovarian cells. Zona pellucida glycoproteins perform a variety of functions. For example, the mouse ZP proteins previously designated ZP2 and ZP3 are complexed into long filaments which are cross-linked by the protein designated ZP1 in the ZP matrix providing structural integrity to the matrix. Wassarman, P.M., *Annu. Rev. Biochem.* 57:415-442 (1988). In addition to its structural role, mouse ZP3 has been shown to be a sperm receptor in the ZP matrix. Bleil, J.P. and Wassarman, P.M., *Cell* 20: 873-882 (1980). Following binding of sperm to ZP3 and the subsequent induction of the sperm acrosome reaction on the surface of the ZP, ZP2 acts as a secondary sperm receptor that is necessary for the maintenance of sperm binding to the egg. Bleil *et al.*, *Dev. Biol.* 128: 376-385 (1988). Because of its role in the maintenance of the oocyte and in sperm-oocyte interactions, the ZP represents a logical target for design of contraceptive agents which interfere with the fertilization process.

Various groups have undertaken an immunological approach in attempts to interfere with ZP functions and thus to decrease fertility in immunized animals. See, Dunbar *et al.* In: *International Congress on Reproductive Immunology*. T. Wegman and T. Gills (eds.). London: Oxford Press, pp. 505-528 (1983); and Dunbar *et al.* In: *Mechanisms and Control of Animal Fertilization*. J. Hartman (ed.) Academic Press, New York, pp. 139-166 (1983). These studies showed that active immunization of mammals with ovarian homogenates decreased fertility. However, the large number of components in such homogenates made the identification of antigens responsible for the decrease in fertility nearly impossible. In addition, the use of such a complex mixture creates a potential for unwanted and potentially harmful side-effects.

Research by various investigators using chromatographic methods including SDS polyacrylamide gel electrophoresis (PAGE) and high pressure liquid chromatography (HPLC) have resulted in the identification of

- 3 -

numerous zona pellucida proteins from a variety of mammalian species. Data compiled by Timmons and Dunbar in *"Perspectives in Immunoreproduction: Conception and Contraception"*; pp. 242-260, Mathur, S. and Fredericks, C.M. eds.; New York, Hemisphere Publishing Co (1988), as described below, illustrate examples of zona pellucida proteins that have been characterized.

Zona pellucida proteins isolated from pig include: PZI, a 40-110 kD protein isolated by Dunbar *et al.*, *Biol. Reprod.* 24:1111 (1981); PZII, a 70-110 kD protein, PZIII, a 95-118 kD protein, and PZIV, an 18-25 kD protein, all isolated by Dunbar *et al.*, *Biol. Reprod.* 32:619 (1985); 90K, a 89-119 kD protein, 65K, a 61-83 kD protein, 55K, a 47-66 kD protein, and 25K, an 18-26 kD protein, all isolated by Hedrick, J.L. and Wardrip, N.J. *Biochem.* 157: 63 (1986); ZP1, an 82-118 kD protein, ZP2, a 58-96 kD protein, ZP3 (PPZA), a 40-74 kD protein, and ZP4, a 21 kD protein, all isolated by Subramanian *et al.*, *Biol. Reprod.* 24:933 (1981); 87K (ZP1/ZP2), a 77-97 kD protein, 58K, a 40-70 kD protein both isolated by Yurewicz *et al.*, *Biol. Reprod.* 29: 511 (1983); deglycosylated PZI, a 35 kD protein; PZII, a 55 kD protein; and PZIII, an 80 kD protein all isolated by Skinner and Dunbar as described in *Immunological Approaches to Contraception and the Promotion of Fertility*, G. P. Talwar (ed.) New York: Plenum pp. 251-268 (1986); and deglycosylated ZP3 having a molecular weight of 45 kD isolated by Sacco *et al.*, *J. Reprod. Fertil.* 76:575 (1986).

Isolated rabbit zona pellucida proteins include: RZI, RZII, and RZIII, having molecular weights of 68-125 kD, 80-100.5 kD, and 100-132 kD respectively, all isolated by Dunbar *et al.*, *Biol. Reprod.* 24:1111 (1986); ZP1, ZP2, and ZP3 having molecular weights of 100-118 kD, 83-110 kD, and 80-92 kD respectively, all isolated by Sacco *et al.*, *Proc. Soc. Exp. Biol. Med.* 167:318 (1981); deglycosylated RZI, and RZII having molecular weights of 65 kD, and 80kD respectively, both isolated by Skinner and Dunbar and described in *Immunological Approaches to Contraception and Promotion of Fertility*. G.P. Talwar (ed.). New York: Plenum, pp. 251-268 (1986); and

- 4 -

deglycosylated RZIII, a 90 kD protein isolated by Timmons and Dunbar, *Biol. Reprod.* 36: 1275 (1987).

A number of mouse zona pellucida proteins have been isolated including: ZP1, ZP2, and ZP3 having molecular weights of 200 kD, 120 kD, and 83 kD respectively, all isolated by Bleil and Wassarman *Dev. Biol.* 76:185 (1980); and ZP1 and ZP2 having molecular weights of 166-122 kD and 90-92 kD respectively, isolated by Sacco *et al.*, *Proc. Soc. Exp. Biol. Med.* 167: 318 (1981). The differences in the molecular weights of mouse ZP1 and ZP2 as reported by Bleil *et al.* and Sacco *et al.* may be due to the fact that Bleil used 2D-PAGE under non-reducing conditions while Sacco used 2D-PAGE under reducing conditions.

The cat zona pellucida proteins CZI and CZII were isolated by Maresh and Dunbar *J. Exp. Zool.* 244:299 (1987) and have molecular weights of 50-110 kD and 90-110 kD respectively.

Maresh and Dunbar *J. Exp. Zool.* 244:299 (1987), have also isolated the dog zona pellucida proteins DZI, DZII, and DZIII which have molecular weights of 50-110 kD, 70-95 kD, and 90-100 kD respectively.

Sacco *et al.*, *Proc. Soc. Exp. Biol. Med.* 167:318 (1981) described squirrel monkey ZP1, ZP2, ZP3, and ZP4 having molecular weights of 63-78 kD, 63-70 kD, 47-51 kD, and 43-47 kD respectively. In the same publication

Sacco *et al.* described human ZP1, ZP2, and ZP3 having molecular weights of 80-120 kD, 73 kD, and 59-65 kD respectively.

To date, few mammalian zona pellucida genes or proteins have been isolated and sequenced. None has been successfully used to produce an effective immunocontraceptive. A lack of consensus among those of skill in the art regarding the number and characteristics (e.g. molecular weight) of proteins present in the zona pellucida of various mammalian species, and difficulties in purifying these heavily glycosylated proteins have hampered

- 5 -

attempts to utilize zona pellucida proteins to produce an effective immunocontraceptive with predictable function.

A number of groups have had success in cloning cDNAs or genes encoding various mammalian zona pellucida proteins.

5 Ringuette *et al.*, *Dev. Biol.*, 127:287-295 (1988) and Liang *et al.*, *Mol. Cell. Biol.*, 10:1507-1515 (1990), reported cloning of mouse DNA encoding zona pellucida proteins ZP3 and ZP2, respectively. The clones were obtained by screening mouse cDNA libraries with anti-ZP3 and anti-ZP2 antibodies. No sequence homology was found between mouse ZP3 and ZP2.

10 Ringuette *et al.*, *Proc. Natl. Acad. Sci. USA*, 83:4341-4345 (1986), reported isolation of a partial cDNA clone for mouse ZP3, which clone hybridized with total genomic DNA of mouse, rat, dog, cow, and human, but not with pig or rabbit genomic DNA unless the hybridization was performed at very low stringency. The full length ZP3 cDNA characterized
15 by Ringuette *Dev. Biol.* 127:287-295(1988) represents a germ-line specific mRNA having relatively short 5' and 3' untranslated regions and an open reading frame of about 1317 nucleotides with an additional 200-300 nucleotide poly-A tail. Ringuette also found that rat, rabbit, dog, and cow ovary transcribes mRNA which hybridized to the mouse ZP3 cDNA and that the
20 ZP3 transcripts had similar molecular weights. Liang *et al. Mol. Cell. Biol.*, 10:1507-1515 (1990), showed that the nucleic acid and deduced amino acid sequence of ZP2 is distinctly different from that of ZP3 although it had the same short motif of 5' and 3' untranslated regions. The ZP2 mRNA is reported to have single open reading frame of 2,139 nucleotides which codes
25 for a polypeptide of 80,217 Daltons representing 713 amino acids.

Chamberlin and Dean, *Dev. Biol.* 131:207-214 (1989) and Kinloch, R.A. *et al.*, *Proc. Nat. Acad. Sci. USA*, 85:6409-6413 (1988) have reported the cloning of the mouse ZP3 gene. The mouse ZP3 gene is reported to have 8 exons and 7 introns in a transcription unit of 8.6 kbp.

- 6 -

Kinloch *et al.*, *Dev. Biol.* 142:414-421 (1990), reported cloning of hamster genomic ZP3 DNA from a hamster genomic DNA library screened with mouse ZP3 DNA as a probe. The hamster ZP3 gene has a transcription unit of 7900 nucleotides and was found to contain 7 introns and 8 exons. The hamster ZP3 protein is approximately 81 % homologous to mouse ZP3 protein. The hamster transcript contained 1266 nucleotides, six less than mouse ZP3 mRNA.

Chamberlain and Dean, *Proc. Natl. Acad. Sci. USA* 87:6014-6018 (1990), reported the cloning of human ZP3 from a human genomic DNA library using mouse ZP3 cDNA as a probe. The human ZP3 gene is composed of 8 exons in a transcription unit of 18.3 kbp. The exons are almost identical in size to the eight exons of mouse ZP3 and the nucleotide sequence of the coding region is 74 % homologous. The human ZP3 transcript is very similar to mouse ZP3 mRNA. Both have short 5' and 3' untranslated regions, and both have a single open reading frame of 1272 nucleotides that encodes a 424-amino acid protein.

U.S. Patent No. 4,996,297, to Dunbar, reported the isolation of three rabbit zona pellucida clones encoding rabbit ZP1 and ZP2 proteins, using anti-ZP1 and anti-ZP2 antibodies as screening probes. The sequences designated as P2 and P3 in Figure 4 of the Dunbar patent represent rabbit ZP cDNAs of 812 and 1705 nucleotides respectively.

Schwoebel *et al.*, *J. Biol. Chem.* 266:7214-7219 (1991), isolated and characterized a full length cDNA (designated rc 55) encoding the 55-kD rabbit zona pellucida protein using cross-species affinity purified antisera. The protein encoded by this cDNA has some similarity to the mouse ZP2 protein described by Liang. However, comparisons of rc 55 with the mouse ZP3 protein revealed no homology.

The functional activities of the cloned ZP DNAs and their encoded proteins have not been fully characterized and neither has their potential use as immunocontraceptives been demonstrated.

- 7 -

In order to develop a useful zona pellucida product for use in fertility control, particularly in the form of a vaccine, it is highly desirable to purify, isolate, and characterize zona pellucida proteins from a species of an animal of interest. Because of factors such as the purity of such proteins
5 needed for vaccine production, and the high cost and numerous problems associated with purification of these proteins, it would be highly desirable to ascertain the DNA and amino acid sequences of zona pellucida proteins of a specific species of interest. Having such known, isolated and characterized zona pellucida proteins, the function of each zona pellucida protein may be
10 understood and a fertility control product may be designed based upon the specific functional characteristics of a particular zona pellucida protein and for a particular mammalian species.

It would be thus highly useful and desirable to provide isolated, purified, sequenced, and characterized recombinant zona pellucida proteins
15 which would permit the development of fertility control products possessing specific reproducible effects in eliciting transient and/or permanent infertility. Such products, where used to elicit transient infertility, would desirably have long lasting effects so as to minimize the number of times the immunocontraceptive agent must be administered to maintain infertility.

20 SUMMARY OF THE INVENTION

The present invention provides novel methods and materials for inducing either reproducible transient or permanent infertility effects in female mammals, including humans, by selective administration of homologous and/or heterologous mammalian species ZP proteins or immunocontraceptively
25 active fragments thereof hereinafter designated as ZPA, ZPB and ZPC. By "reproducible" is meant that, unlike prior art attempts to induce transient infertility by administration of ZP proteins (in the form of mixtures of such proteins), this invention achieves its transient infertility effects by the administration of ZPA and/or ZPB in a form such that the duration of

- 8 -

transient infertility is controllable and can be maintained in an on or off condition in a controllable and/or predictable fashion. This is achieved primarily through administration of the highly pure ZPA and ZPB proteins or immunocontraceptively active fragments thereof of this invention, e.g., in
5 recombinant form and thus essentially devoid of ZPC. By immunocontraceptively active fragments is meant a ZP protein fragment capable of inducing infertility.

In one of its aspects, the present invention provides methods for inducing reproducible transient infertility in a mammal by administering to a
10 subject female mammal a zona pellucida protein (or fragment thereof) selected from the group consisting of mammalian ZPA, and ZPB, and combinations thereof in doses effective to stimulate production in said mammal of antibodies which recognize ZPA or ZPB proteins of said mammal. It is presently preferred that mammalian ZPA and ZPB for use in such methods be derived
15 from the same mammalian species as the subject mammal although the use of heterologous species proteins is also contemplated. Use of purified isolates of mammalian ZPA or ZPB protein such as obtained by chromatographic separatory procedures is contemplated. Use of proteins produced by recombinant methods is expected to be most preferred.

20 According to another aspect of the invention, methods are provided for inducing permanent sterility in a female mammal by administering to a subject female mammal a recombinant mammalian ZPC protein (or fragment thereof) in a form essentially devoid of ZPA and/or ZPB, in a dose effective to stimulate production in said female mammal of
25 antibodies which recognize the ZPC protein of said mammal. As is the case with induction of transient infertility, use of homologous species ZPC is preferred, but not required, and the protein may be derived from natural sources or produced by recombinant methods. Modified ZPC proteins including but not limited to palmitylated and chitosan modified proteins are
30 also contemplated by the present invention.

- 9 -

Presently preferred ZPA, ZPB, and ZPC proteins for veterinary application of the transient infertility and sterility inducing methods include porcine, rabbit, canine, feline, bovine, and cynomolgus monkey ZP proteins.

In another of its aspects, the present invention provides
5 pharmaceutical compositions for use in inducing reproducible transient infertility in a female mammal (including humans) comprising an effective dose of a zona pellucida protein (or fragment thereof) selected from the group consisting of mammalian ZPA, and ZPB (substantially free of ZPC), in combination with one or more pharmaceutically acceptable carriers, diluents
10 and adjuvants. Modified ZPA and ZPB proteins (for example, palmitylated or chitosan modified) are also contemplated by the present invention.

According to another aspect of the present invention, novel purified and isolated DNA sequences are provided which encode porcine ZPA, ZPB, and ZPC, as illustrated by the DNA sequences set out in SEQ ID NOS.
15 1, 3, and 5. Also, provided are purified and isolated DNA sequences encoding: rabbit ZPC, as illustrated by the DNA sequence set out in SEQ ID NO. 7; canine ZPA and ZPC, as illustrated by the DNA sequences set out in SEQ ID NOS. 9 and 11; feline ZPA, ZPB, and ZPC, as illustrated by the DNA sequences set out in SEQ ID NOS. 13, 15, and 17; bovine ZPA, ZPB,
20 and ZPC, as illustrated by the DNA sequences set out in SEQ ID NOS. 19, 21, and 23; human ZPA and ZPB as illustrated by sequences set out in SEQ ID NO. 42 and 40, respectively, and as contained as human DNA inserts in lambda phage clones A1 and A4, (ZPA) and as contained in human DNA inserts in lambda phage clones 1-1 and 4-9 (ZPB).

25 Polynucleotide sequences of the invention are useful for the production of ZPA, ZPB and ZPC proteins by recombinant methods and as probes for the isolation of heterologous species polynucleotides encoding corresponding zona pellucida proteins by hybridization methods.

Also provided by the present invention are novel host cells,
30 especially unicellular eucaryotic and procaryotic cells, stably transformed or

- 10 -

transfected with polynucleotides of the invention in a manner allowing expression of the ZP proteins (or immunologically significant fragments thereof) in the host cells. Host cells expressing such ZP products, when grown in a suitable culture medium, and particularly useful for large scale production processes wherein the desired polypeptide products, in glycosylated or non-glycosylated form are isolated from the cells or the medium in which the cells are grown.

Recombinant polypeptides provided by the invention thus comprise ZPA, ZPB and ZPC, and full equivalents of such zona pellucida proteins including both glycosylated and non-glycosylated forms, variants and immunologically active fragments thereof which retain substantial biological activity, i.e., at least one of the biological activities of the zona pellucida protein discussed herein, e.g., the ability to stimulate the production of antibodies as discussed herein upon administration to a mammal. Such immunologically active fragments may be defined as containing at least one epitope effective to stimulate the production of antibodies upon administration to a mammal in accordance with this invention.

In another aspect of the invention, a method is provided for the isolation of nucleic acid sequences encoding other mammalian ZPA, ZPB, and ZPC proteins by hybridization under stringent conditions of heterologous species ZPA, ZPB, and/or ZPC probes to cDNA or genomic DNA libraries, derived from the mammalian species of interest.

More particularly, it is an aspect of the invention to provide a method for the isolation of nucleic acid sequences encoding human ZPA and ZPB by hybridization under stringent conditions of sequences encoding ZPA and/or ZPB from heterologous species.

Other aspects and advantages of the present invention will be readily understood upon consideration of the following detailed description of presently preferred embodiments thereof, reference being made to the figures wherein:

DETAILED DESCRIPTION OF THE INVENTION

The present invention is directed to mammalian zona pellucida proteins characterized in three major classes: ZPA, ZPB, and ZPC. This classification scheme has resulted from repetitive screening of various mammalian ovarian cDNA libraries and retrieval of clones which encode proteins showing significant homology in three distinct groups, designated herein as ZPA, ZPB and ZPC. Although similarity is seen between DNA sequences encoding ZPA, ZPB, or ZPC between animal species, very little homology is found between the individual species' ZPA, ZPB, and ZPC proteins.

DNA sequences encoding zona pellucida proteins A, B, and C and their deduced amino acid sequences for various mammalian species ZPs are presented in SEQ ID NOS. 1-24. It is understood that the DNA sequence of a particular animal may vary slightly due to the phenomenon of allelic variation. Small differences in the precise DNA sequence between animals or slight errors due to the inefficiency of sequencing procedures are to be

- 12 -

expected. Such variants are included within the scope of the present invention.

The zona pellucida DNA sequences described above were obtained from ovarian cDNA libraries screened with specific zona pellucida antibodies or known zona pellucida DNA probes. Comparison of isolated
5 sequences to published protein or DNA sequences and with other clones as they were isolated was used to classify and identify the clones as described above.

The term "zona pellucida protein" is meant to include full
10 length proteins ZPA, ZPB, and ZPC, as well as expected variants, immunologically active fragments or peptides contained within these proteins. The term "zona pellucida DNA" is meant to include those nucleic acid sequences encoding zona pellucida protein or fragments thereof.

The three major classes of mammalian zona pellucida proteins
15 have been determined on the basis of homology within the DNAs encoding ZP proteins of a variety of mammalian species. ZPA includes those peptides previously, variously described in the literature as ZP1, ZP2, and ZP4; ZPB includes those peptides previously, variously described as ZP3 α and rc 55; and ZPC includes those peptides previously variously described as ZP3 β and
20 ZP3.

The homology of various species of zona pellucida proteins within a specific class as compared with a consensus sequence for each class is shown in Table 1. The consensus sequence was derived using the Microgenie® Sequence Analysis Program (Beckman Instruments, Inc. Spinco
25 Division, Palo Alto, CA). The minimum percent of aligned sequences which must have the same residue at a given position for that residue to be included in the consensus sequence was 50%. The DNA sequences corresponding to the amino acid consensus sequences for ZPA, ZPB, and ZPC proteins are set out in SEQ ID NOS 25, 26, and 27, respectively.

- 13 -

TABLE 1

HOMOLOGY OF DEDUCED ZP PROTEINS AMINO ACIDS

		<u>ZPA</u>	<u>ZPB</u>	<u>ZPC</u>
	DOG	78.9%	--	77.3%
5	CAT	78.4%	70.9%	77.5%
	COW	77.2%	80.4%	77.2%
	PIG	73.0%	77.8%	79.0%
	RABBIT	70.1%	74.6%	71.3%
	MOUSE	61.6%	--	69.6%
10	HUMAN	--	--	76.9%
	HAMSTER	--	--	70.5%

The deduced amino acid sequences of the various species of zona pellucida proteins suggest approximate unglycosylated molecular weights of 75 kD, 55 kD, and 45 kD for ZPA, ZPB, and ZPC, respectively. A more detailed analysis of both DNA sequence homology and deduced amino acid sequence homology is set out as Examples 13, 14, and 15.

It has surprisingly been found that administration of a specific class of zona pellucida protein to a host animal results in a specific immunocontraceptive effect and that selection of the appropriate ZP protein for administration allows induction of desired contraceptive results, in terms of permanent sterility or transient infertility. For example, vaccination of an animal with zona pellucida protein C induces antibody titers in that animal which recognize endogenous ZPC resulting in loss of oocytes from the animal's ovary, thereby causing permanent sterility. In contrast, vaccination of an animal with zona pellucida protein A, B or combinations thereof induces antibody titers which do not recognize ZPC, but recognize ZPA and/or ZPB. This results in cycling, infertile animals for the time period during which

- 14 -

anti-ZPA and/or anti-ZPB antibody titers remain high. When such antibody titers fall, the infertility effect is diminished, and the animal regains fertility.

Vaccination with the purified, isolated, and characterized ZPA, ZPB, or ZPC proteins is seen to exert a specific effect on the immunized animal if an autoimmune response is triggered wherein the autoantibodies generated specifically recognize the immunized animals' own specific zona pellucida protein. This self-recognition for antibodies induced according to the present invention may be defined and characterized by the ability of serum antibodies to recognize at least one epitope present on a homologous species zona pellucida protein.

In the preferred method of the invention, an animal is immunized with a recombinant ZPA, ZPB, or ZPC or fragments thereof. The recombinant protein or peptide may be of homologous species or derived from a heterologous species zona pellucida which shares common epitopic determinants, with the proviso that such common epitopic determinants function to induce the desired autoimmune response.

The recombinant protein or peptide fragment may be chemically conjugated to immune enhancing agents such as Keyhole Limpet Hemocyanin (KLH), and Muramyl dipeptide (MDP), and the like, or alternatively may be provided in the form of a fusion protein, e.g., with foreign protein amino acids at the amino and/or carboxy terminus. Fully conventional methods for stimulating the production of antibodies upon administration of the proteins or fragments of this invention are well known; similarly, passive immunization techniques involving administration of antibodies *per se*, e.g., anti-ZPA antibodies, anti-ZPB antibodies, or anti-ZPC antibodies, to the zona pellucida proteins or fragments of this invention is also within the scope of the invention. For details, see Dean, PCT Application WO90/15624 whose disclosure is entirely incorporated by reference herein.

Thus, to induce permanent sterility in a dog, recombinant canine ZPC may be employed which is expressed as a bacterial fusion protein

- 15 -

(or conjugated to immune enhancing agents) wherein active canine ZPC protein is conserved and available for interaction with antigen presenting cells. The expressed protein is then administered to a host dog and induces an autoimmune response in which generated antibodies recognize canine zona pellucida protein C. This autoimmune effect, which specifically recognizes dog ZPC protein or its aggregates, induces permanent sterility in the vaccinated dog, which sterility is associated with a loss of oocytes from the dog's ovary.

Alternately, a non-homologous species ZPC, such as recombinant porcine ZPC or peptides thereof which are cross-reactive with canine ZPC, can be administered to a dog to achieve similar sterilizing effects. The sterilizing effect, however, is only realized when antibodies capable of recognizing the host's own native zona pellucida are induced (or administered in the context of passive immunization).

In an alternative embodiment of the present invention, the administration of a host species' own A and/or B class zona pellucida protein, or a related A and/or B protein from another species which induce antibodies against the host's ZPA and/or ZPB proteins results in an infertility effect which is distinct from that produced by ZPC class antigens. The physiological effect of vaccination with the ZPA and ZPB proteins is a transient one. "Transient infertility" is herein defined as infertility which is maintained when antibodies against self-zona pellucida proteins are sustained in the host animal's circulation at a contraceptively effective concentration (e.g., at titers of approximately 1:250 in the dog) and which infertility is diminished when antibodies against self fall below a contraceptively effective lower limit. The reduction in antibodies against self-zona pellucida results in restoration of fertility without evidence of major physiological changes in the ovary. Typically, the reduction in antibody titers occur by natural processes in the mammalian host, but other methods of reducing antibody titers are within the scope of the invention.

- 16 -

Contraceptively effective antibody titers against self zona pellucida proteins A and B required to maintain infertility will vary with the species of vaccinated animal as well as with the species of recombinant ZPA or ZPB peptide administered, but may readily be determined, for example, by testing a panel of the desired animal species with varying doses of the specific antigen, measuring the induced titer of anti-self antibodies by known ELISA techniques, and correlating the titers with reproductive indicators, e.g., cycling, hormone levels, and the like. In general, antibody titers greater than 1:250 are contraceptively effective.

Based on amino acid sequence homologies, it is expected that all zona pellucida proteins of a particular class contain functional epitopes which are cross-reactive between mammalian species. However, absent characterization and identification of such functional cross-reactive epitopes, a preferred, selective contraceptive agent is a homologous species zona pellucida protein or antibody thereto.

The present invention will be more completely understood upon consideration of the following illustrative examples of the practice thereof wherein: Example 1 addresses the isolation of DNAs encoding porcine species ZPA, ZPB and ZPC; Example 2 relates to isolation of rabbit ZPC DNA; Example 3 relates to isolation of DNAs encoding canine ZPA and ZPC; Example 4 addresses isolation of feline DNAs encoding ZPA, ZPB and ZPC; Example 5 relates to cloning and isolation of DNAs encoding bovine species ZPA, ZPB and ZPC; Examples 6 and 7 describe immunocontraceptive treatment of dogs with naturally-derived porcine zona pellucida proteins; Example 8 relates to serochemical studies on animals treated in Examples 6 and 7; and Examples 9 and 10 address recombinant production of a canine ZPC fusion protein and its immunocontraceptive use in dogs. Example 11 relates to the isolation of DNAs encoding human ZPA and ZPB by methods described herein. Example 12 relates to the isolation and sequencing of DNAs encoding cynomolgus monkey ZPA, ZPB and ZPC. Examples 13-15 relate

- 17 -

to the comparison of the DNA sequence and the deduced amino acid sequence of mammalian ZPA, ZPB, and ZPC, respectively. Example 16 relates to the immunization of cynomolgus monkey using HSPZ and fractionated HZPC. Example 17 relates to the mapping of mammalian zona pellucida protein epitopes. Example 18 describes the immunization of dogs using recombinant ZPC proteins. Example 19 relates to the vaccination of cows and cats with recombinant ZP proteins.

Example 1

Isolation of DNA Sequences Encoding

10 Porcine Zona Pellucida Proteins ZPA, ZPB, and ZPC.

A cDNA library in λ gt11 was commercially prepared by Clone Tech, Palo Alto, CA, from an ovary isolated from a 14 week old pig and was screened using an anti-ZP3 β antibody obtained from E.C. Yurewicz and described in Keenan *et al.*, *Biol. Reprod.*, 44:150-156 (1991). Eight
15 candidate clones were identified.

A degenerate DNA oligonucleotide probe (19bps) was constructed to represent all possible sequences of a short portion of the N-terminus porcine ZP3 β as described in Yurewicz *et al.*, *J. Biol. Chem.*, 262:564-571, (1987). The degenerate probe sequence is set out in SEQ ID
20 NO. 28.

Southern analysis of the eight candidate clones isolated by expression screening with the degenerate DNA oligonucleotide probe resulted in hybridization with two of the eight candidates. The two clones recognized by the degenerate probe were then subcloned into the pBS KS plasmid
25 (STRATAGENE Cloning Systems, La Jolla, CA) for sequence analysis using the sequence enzyme and the protocol described in the SEQUENASE® Manual (U.S. Biochemical, Cleveland, OH). One of the clones, B-8, having an insert size of approximately 1200 base pairs, included a sequence homologous to the

- 18 -

N-terminal sequence of mouse ZP3, previously identified by Ringuette *et al.*, *Dev. Biol.*, 127:287-295, (1988). The remaining clone, B-6, had an insert size of approximately 1000 base pairs. Neither hybridizing clone contained the C-terminal portion of the gene, as suggested by the lack of homology to the mouse ZP3 gene in this region.

The 14-week porcine ovarian library was then rescreened by DNA hybridization. Approximately 150,000 PFUs were plated on agar plates with *E. coli* Y1090. After overnight incubation at 37°C, nylon membrane lifts of plaques were prepared and screened using the B6 and B8 clones derived above isolated by screening with the degenerate oligonucleotide probe set out in SEQ ID NO. 28.

Filters were prehybridized in a solution containing 5X saline, sodium phosphate, EDTA buffer (SSPE), 5X Denhardt's Reagent, 100µg/ml salmon sperm DNA, 30% formamide and 0.5% SDS for three hours at 42°C. Approximately 50 ml of the prehybridization solution was used for 12 filters (132 mm). After prehybridization, 10 ng of freshly radiolabeled DNA probe in 30% formamide, 5X SSPE was added. The probes were heat denatured at 95°C for 3-5 minutes and hybridization with the DNA probes continued overnight at 42°C. The hybridized filters were then washed twice with 100 ml of 5X SSPE at 55°C, for approximately one hour each wash. The filters were then rinsed with 250 ml of 5X SSPE at room temperature and allowed to air dry. The dried filters were exposed to x-ray film at -70°C using intensifier screens for at least eight hours and the films were developed for visual analysis.

Among the additional clones isolated were two clones including the C-terminal portion of the porcine ZP3β gene. One clone, λ5-1, was subcloned into plasmid pBS KS and sequenced. This plasmid, termed pZ57, contained a ZP DNA insert having 1266 base pairs and appeared to encode the full length amino acid sequence of porcine ZP3β as compared with known mouse ZP3. Alignment of the deduced amino acid sequence of the clone with

- 19 -

the known N-terminal amino acid sequence of ZP3 β reported by Yurewicz *et al.*, *J. Biol. Chem.*, 262:564-571 (1987), and an internal peptide sequence of ZP3 β corresponding to amino acids 255-274 as provided by E.C. Yurewicz confirmed the identity of this clone as encoding porcine ZP3 β .

5 The DNA sequence of this clone, termed porcine ZPC, is set out in SEQ ID NO. 5 and its deduced amino acid sequence is set out in SEQ ID NO. 6.

 The 14-week porcine ovarian cDNA library was further screened using rabbit zona pellucida rc 55 cDNA as a probe [described in
10 Schwoebel *et al.*, *J. Biol. Chem.*, 266:7214-7219, (1991)].

 One candidate clone of approximately 1700 base pairs, λ 2-1, was isolated and was transferred into the sequencing plasmid pBS KS. The DNA sequence and deduced amino acid sequence of the porcine DNA insert was determined using the method described in the SEQUENASE[®] manual (US
15 Biochemical Corporation, Cleveland, Ohio). The sequenced clone contained 1620 base pairs and included a full length copy of the porcine ZP3 α gene as confirmed by alignment of the deduced amino acid sequence with portions of the known protein sequence of porcine ZP3 α provided by E.C. Yurewicz between amino acids 206-222, 271-279, and 328- 344. The DNA sequence
20 of this clone, termed porcine ZPB, is set out in SEQ ID NO. 3. Its deduced amino acid set out in SEQ ID NO. 4.

 The 14-week porcine ovarian library was further screened using the procedure described above and using a DNA probe encoding canine ZPA protein (as obtained in Example 3 below, SEQ ID NO. 9). A single clone,
25 λ 3-5 having approximately 1300 base pairs, was obtained representing the N-terminal 60% of the theoretical porcine ZPA gene as estimated by the size of the clone in relation to the ZP2 gene isolated from mouse by Liang *et al.*, *Mol. Cell. Biol.* 10:1507-1515 (1990), and rabbit by Dunbar, U.S. Patent No. 4,996,297, and dog (see Example 3 below).

- 20 -

This clone was then used to rescreen the porcine ovarian library. Three additional clones were obtained, two small clones and one clone large enough to contain the full length sequence. The large candidate clone, λ B, having approximately 2200 base pairs, was sequenced, and the data
5 showed this ZPA clone to lack only approximately seven base pairs of the full length sequence including the ATG start codon when aligned with the mouse ZP2 gene and the canine ZPA gene described in Example 3. The DNA sequence of this clone, termed porcine ZPA, is set out in SEQ ID NO. 1. Its deduced amino acid sequence is set out in SEQ ID NO. 2.

10 This isolated porcine clone included sequences corresponding to published sequences of three identified porcine zona pellucida proteins, ZP1 (80kD), ZP2 (62kD) as disclosed in U.S. Patent No. 4,996,297 to Dunbar and ZP4 (21kD) as disclosed by Hasegawa *et al.*, Abst. No. 382, *Meeting Soc. Study Reprod.* July, 1991. These results suggest that a singular clone encodes
15 one zona pellucida protein which previously had been thought to exist as three separate proteins, i.e., ZP1, ZP2, and ZP4. This further suggests that only three major porcine zona pellucida genes encode three major zona pellucida proteins which here are termed ZPA, ZPB, and ZPC. ZPA includes those proteins previously identified as ZP1, ZP2, and ZP4. ZPB corresponds to
20 ZP3 α and ZPC corresponds to previously identified ZP3 β . Yurewicz *et al.* *J. Biol. Chem.*, 262:564-571, (1987).

Example 2

Isolation and Purification of DNA Sequences

Encoding Rabbit ZPC Protein

25 Ovaries were removed from five week old rabbits and mRNA was prepared using the Fast Track™ mRNA isolation kit in accordance with the procedure described in the *Fast Track™* instruction manual, version 3.1, catalog No. K1593-02 (Invitrogen, San Diego, CA). A Lambda Librarian™

- 21 -

kit (Invitrogen, San Diego, CA) was used to prepare cDNA and to clone cDNAs into λ gt10 according to the manufacturer's instructions. Approximately 150,000 PFUs were plated on agar plates with *E. coli* Y1090. After overnight incubation at 37°C, nylon membrane lifts of colonies were prepared and screened with a porcine ZPC DNA probe using the screening procedures described for Example 1. The probe used was the porcine ZPC sequence as set out in SEQ ID NO. 5.

Two positive clones, λ R4 and λ R5, hybridized with the porcine ZPC DNA. The size of each of these clones as estimated in agarose gels was approximately 1300 base pairs. Both λ R4 and λ R5 were sequenced as described for Example 1. The sequences were identical except that λ R5 contained four additional nucleotides at the 5' end. The determined DNA sequence was approximately 75% homologous to the DNA sequence encoding porcine ZPC.

The DNA sequence encoding rabbit ZPC protein is set out in SEQ ID NO. 7. Its deduced amino acid sequence is set out in SEQ ID NO. 8.

Rabbit ZPA and ZPB proteins have been previously identified by Dunbar in U.S. Patent No. 4,996,297 as P2 and P3, respectively.

20

Example 3

Isolation of DNA Sequences Encoding Canine Zona Pellucida Proteins ZPA and ZPC

A 16 week canine ovarian cDNA expression library was commercially prepared by Clone Tech, Palo Alto, CA, in λ gt11 generally following the methods described in Example 1. The canine ovarian cDNA library was screened using antibodies raised against heat solubilized canine zona pellucida. Heat solubilized canine zona pellucida (HSDZ) was prepared generally following the procedures described in Dunbar *et al. Biochemistry*,

25

- 22 -

19:356-365, (1980) except ganged razor blades were used to mince the ovaries.

Rabbits were immunized with 250 μ g HSDZ and 250 μ g MDP. Two additional boosts followed at approximately three week intervals. The resultant rabbit serum was used to screen the canine ovarian cDNA expression library. Seven candidate clones were obtained. Cross-hybridization experiments were performed by Southern blot analysis as follows. The largest clone, λ 26-1, having approximately 1300 base pairs, was first used as a probe against all of the other clones in Southern blots. Three other clones were identified. The largest of the remaining clones, λ 20-1 and λ 7-1, having approximately 800 and 1000 base pairs respectively, were then used as probes in Southern blots. These probes identified no additional clones. This cross hybridization analysis of the seven candidate clones to each other indicated that four of these clones were related, e.g. four clones hybridized to λ 26-1 while the remaining three λ 20-1, λ 7-1, and λ 19-3 were independent.

The largest of the four related clones, λ 26-1, was subcloned into pBS KS plasmid for sequence analysis according to the procedure described in Example 1. The analyzed sequence demonstrated the presence of a long open reading frame of 1278 base pairs encoding a protein of approximately 426 amino acids. Comparison of the deduced amino acid sequence of this clone with the sequences of known zona pellucida proteins, indicated this clone encoded a protein related to mouse ZP3 (ZPC) as reported by Ringuette *et al.*, *Dev. Biol.* 127:287-295 (1988), hamster ZP3 as reported by Kinloch *et al.*, *Dev. Biol.*, 142:414-421 (1990), human ZP3 as reported by Chamberlin *et al.*, *Proc. Natl. Acad. Sci. USA* 87:6014- 6018 (1990) and porcine ZPC protein (see Example 1). The DNA sequence of this clone, termed canine ZPC, is set out in SEQ ID NO. 11. Its deduced amino acid sequence is set out in SEQ ID NO. 12.

The remaining three independent candidate clones were subcloned into the pBS KS plasmid for sequence analysis as described above.

- 23 -

The determined sequence of the 800 base pair clone, λ 20-1, was compared with known ZP sequences by computer analysis as described above and was found to be related to the mouse ZP2 (ZPA) [Liang *et al.*, *Mol. Cell. Biol.* 10:1507-1515 (1990)] and porcine ZPA (see Example 1).

5 The 800 base pair fragment from λ 20-1, was then used as a hybridization probe to rescreen the canine cDNA library. Two additional candidate clones were identified, the larger of which, λ 7A, having approximately 2800 base pairs, was subcloned into pBS KS plasmid for sequence analysis. Comparison of this sequence with known sequences
10 encoding zona pellucida proteins suggested the candidate clone λ 7A contained a full length ZPA sequence, but an incorrect N-terminal sequence, e.g., the clone contained an additional 600 base pairs as determined by alignment with known mouse ZP2 and rabbit ZPA sequences referenced in Example 1. The second candidate clone, λ 9-2, having approximately 1000 base pairs, was then
15 subcloned into the plasmid pBS KS and sequenced. The sequence of the second clone indicated the presence of a correct N-terminal sequence, but included only approximately the N-terminal 40% of the full length clone as determined by alignment with the mouse ZP2 and rabbit ZPA genes. Overlap of the two cDNA clones, however, provided the full length sequence.

20 The appropriate pieces of each clone were subcloned as follows to generate the correct full length zona pellucida clone containing a 2028 base pair open reading frame encoding a protein of approximately 676 amino acids. The λ 7A DNA was digested with Eco RI to yield two insert fragments (2000 bps and 800 bps). These two fragments were each subcloned into pBS KS
25 yielding pZ36 and pZ37, respectively. Plasmid pZ37 carried the C-terminal portion of this sequence. The λ 9-2 DNA insert was removed from the λ vector and subcloned into pBS KS to yield pZ38. Plasmid pZ36 was digested with Hind III to remove approximately 1350 bps of the N-terminal portion of the λ 7A gene fragment (about 850 bps of nonsense DNA and 500 bps of
30 coding sequence). This digestion also removed one of the Eco RI insert ends

- 24 -

and left a single Eco RI site. The pZ37 Eco RI insert was then moved into the single remaining Eco RI site in the modified pZ36 (pZ36 Δ 1) to reestablish the relative DNA structure orientation that existed in the λ 7A insert (1450/2800 bps). This combined plasmid was then opened with Hind III and the Hind III fragment from pZ38 carrying the N-terminal ZP DNA sequence was inserted to create plasmid pZ39 which is a pBS KS carrying the full length canine ZPA sequence. The DNA sequence of this canine ZPA gene is set out in SEQ ID NO. 9. Its deduced amino acid sequence set out in SEQ ID NO. 10.

10

Example 4

Isolation of DNA Sequences Encoding Feline Zona Pellucida Proteins ZPA, ZPB, and ZPC

Ovaries were isolated from five cats approximately three to four months in age. Messenger RNA was isolated from six ovaries using the Fast Track™ mRNA Isolation Kit (Invitrogen, San Diego, CA, Catalog No. K1593-02) using the protocol provided with the kit. cDNA was prepared using the protocol and cloned into λ gt10 as described in Example 2.

Approximately 150,000 plaque forming units (PFUs) were plated on agar plates with *E. coli* Y1090. After overnight incubation at 37°C, nylon transfer membranes were used to prepare and screen plaque lifts. Plaques were screened using a mixture of DNA probes in equal proportions encoding porcine ZPA, ZPB, and ZPC proteins and using the hybridization procedure as described for Example 2. A total of 81 positive clones were identified. Twelve of these clones were plaque-purified. Southern analysis of these clones using porcine ZPA, ZPB, and ZPC DNAs individually as probes indicated that seven of these clones encoded ZPC proteins and one clone encoded a ZPA protein. Four of the clones contained inserts which could not be separated by Eco RI digestion

- 25 -

Five of the ZPC clones were between 1200-1350 base pairs in length. One clone, λ C-112, having approximately 1350 base pairs was subjected to sequence analysis as described above and its deduced amino acid sequence was found to be approximately 70% homologous to the canine ZPC protein obtained in Example 3. The DNA sequence of this feline ZPC clone is set out in SEQ ID NO. 17. Its deduced amino acid sequence is set out in SEQ ID NO. 18.

The single feline ZPA clone, λ C-116, was sequenced and found to be approximately 2215 base pairs in length. The deduced amino acid sequence was approximately 75% homologous to the canine ZPA protein characterized in Example 5. The DNA sequence of this feline ZPA clone is set out in SEQ ID NO. 13. Its deduced amino acid sequence is set out in SEQ ID NO. 14.

The remaining 69 positive clones were rescreened using porcine ZPB DNA as a probe (SEQ ID NO. 3). Ten positive clones were obtained. The largest clone, λ C-1, contained approximately 1.7 kilobases as determined by agarose gel electrophoresis. This clone was sequenced, and its deduced amino acid sequence was found to be approximately 80% homologous to the porcine ZPB protein described in Example 1. The DNA sequence of this feline ZPB clone is set out in SEQ ID NO. 15. Its deduced amino acid sequence is set out in SEQ ID NO. 16.

Example 5

Isolation of DNA Sequences Encoding Bovine Zona Pellucida-Proteins ZPA, ZPB, and ZPC

A cDNA library was constructed from a five month bovine ovary by the method described in Example 2. The bovine ovarian library was screened with DNA hybridization probes representing each of the classes of zona pellucida proteins using a mixture of equal proportions of porcine

- 26 -

DNA probes encoding ZPA (SEQ ID NO. 1), ZPB (SEQ ID NO. 3), and ZPC (SEQ ID NO. 5) proteins, as described for Example 2 and using the procedures described for Example 1. Initial screening yielded three candidate clones. Southern analysis of these clones with individual porcine ZPA, ZPB, and ZPC DNA probes used in the initial screening indicated that one of the clones, λ B2, having approximately 650 base pairs, encoded ZPA. A second clone, λ B-1 having approximately 1000 base pairs encoded ZPB. A third clone, λ B14, having approximately 1200 base pairs, encoded ZPC.

The bovine ovarian library was then rescreened with the mixed porcine ZP DNA probes. Two additional clones were obtained and identified by Southern analysis as encoding ZPC.

The Eco RI inserts of the ZPA, ZPB, and largest ZPC clone were subcloned and their DNA sequences analyzed. The sequences encoding these bovine ZPA, ZPB and ZPC fragments were set out in SEQ ID NOS. 19, 21, and 23, respectively. Their deduced amino acid sequences are set out in SEQ ID NOS. 20, 22, and 24, respectively.

Example 6

Immunization of Dogs with Heat-Solubilized Fractionated Porcine Zona Pellucida

Heat-solubilized, porcine zona pellucida (HSPZ) was prepared generally following the procedures described by Dunbar *et al. Biochemistry*, 19:356-365, (1980) but using a hand powered meat grinder instead of the Zonamatic described. Following isolation, the zona pellucida protein was solubilized in 0.1 M sodium carbonate buffer, pH 9.6, and was dialyzed extensively against 6M urea. The resultant solution, a volume of 2-3ml containing approximately 12 μ g of HSPZ, was subjected to isoelectric-focusing in a BIORAD Rotofor isoelectric-focusing chamber as follows. An isoelectric gradient was established using 1% ampholytes having a pI range of 3-10. The

- 27 -

zona pellucida protein was introduced into the mid-range chamber (pI 7.0) and allowed to focus for approximately four hours at 4°C or until the voltage stabilized.

Twenty isoelectrically focused fractions were collected and
 5 analyzed by SDS PAGE and Western blot analysis for pig zona pellucida proteins. Acidic fractions having a pI range of approximately 3.5-5.5 and which contained the porcine zona pellucida proteins were combined. The fractions were dialyzed into 0.1M carbonate buffer, pH 9.6 and concentrated to approximately 3mg/ml. This antigenic preparation was used to vaccinate
 10 animals as described below. Analysis of this antigenic preparation by two-dimensional gel electrophoresis indicated the presence of ZPA and ZPB protein. However, ZPC was not revealed to be present in this preparation.

The HSPZ antigenic preparation was added to a 50/50 water oil emulsion with incomplete Freund's adjuvant (Sigma, St. Louis, MO)
 15 containing 250µg of MDP per dose. One ml of the 50/50 water oil emulsion contained 0.425 ml paraffin oil, 0.075 ml mannide monooleate, and 0.5 ml PBS containing 250 µg threonyl-MDP (SYNTEX Corporation) and the amount of HSPZ described in Table 3 below.

Four random breed dogs aged 10-12 weeks were immunized
 20 with HSPZ using the regimen described in Table 2.

TABLE 2

			<u>mg HSPZ</u>
	Prime	Time 0	0.1
	Boost #1	Week 4	1.0
25	Boost #2	Week 8	0.25
	Boost #3	Week 12	0.2
	Boost #4	Week 16	1.0
	Boost #5	Week 36	1.0

- 28 -

The antisera produced by these animals was monitored via ELISA methodology. By week 17 antibody titers against self, e.g. against canine zona pellucida proteins, had reached a maximum (8-16K by ELISA) and thereafter began to drop.

5 At week 36, one animal was unilaterally ovariectomized and the removed ovary was sectioned and stained with periodic acid schiff stain (PAS) for histological examination. The ovary appeared normal, as evidenced by the presence of follicles in all stages of development. At week 52, two of the four test animals were observed to exhibit estrus behavior. The remaining
10 two test animals exhibited estrus behavior at approximately one and a half years when the first two test animals experienced their second heat. All test animals were bred repeatedly with competent males and by artificial insemination, however, none became pregnant. During this same period, animals in various test regimens in which no self titers were obtained, as
15 described in Example 10, became pregnant when presented with the same males or artificial insemination techniques.

Two weeks following the breeding sessions, e.g. at 54 weeks, the two early cycling animals were unilaterally ovariectomized and the removed ovaries were sectioned for histological examination. The ovaries
20 appeared normal for this stage of follicular activity despite the functional infertility demonstrated.

Example 7

Vaccination With Porcine ZPC Protein

A purified porcine ZPC protein (ZP3 β) was obtained from E.
25 Yurewicz, prepared as described in *J. Biol. Chem.*, 262:564-571, (1987).

Vaccines were prepared by adding 167 μ g purified porcine ZPC protein (ZP3 β) to a 50/50 water-oil emulsion with complete Freund's adjuvant (Sigma No. F5881, St. Louis MO), for the priming dose or with Incomplete

- 29 -

Freund's Adjuvant (Sigma No. F5506, St. Louis, MO) containing MDP as described in Example 6 for the booster doses.

Five random breed dogs of approximately 10-12 weeks of age were injected with the ZPC vaccine preparation described above using the regimen described in Table 3.

TABLE 3

			<u>mg of ZPC</u>
	Prime	Time 0	0.167
	Boost	Week 3	0.167
10	Boost	Week 6	0.167
	Boost	Week 28	0.167

Each animal's antibody titer versus self- zona proteins, e.g., versus canine zona pellucida proteins, was monitored by ELISA, using the method described in Dunbar, *Two Dimensional Gel Electrophoresis and*
 15 *Immunological Techniques*, 1987. ELISA microtiter plates were coated with HSDZ in antigen-coating buffer (0.1M sodium carbonate, pH 9.6). Biotinylated rabbit-antidog IgG was used as the second antibody. ABC reagent (Avidin-biotinylated peroxidase complex) and O-phenylene diamine dihydrochloride with a peroxide substrate was used for visualization. Only
 20 two animals produced antibodies versus self achieving peak self-antibody titers of 16K by week 4. The other three animals produced no self-antibody titers but achieved peak antibody titers of 4K against porcine zona pellucida protein. During the period of time between week 20 and week 36, all dogs were observed to exhibit estrous behavior. The animals were bred repeatedly with
 25 proven males. Only the two animals having antibody titers versus self zona pellucida proteins remained infertile. All other animals in the study became pregnant.

- 30 -

Two weeks after estrous and breeding the two infertile dogs exhibiting self-antibody titers were unilaterally ovariectomized and the removed ovaries were sectioned and stained with PAS for histological examination. The histological examination revealed abnormal morphology in the ovaries of the infertile dogs. No evidence of ongoing folliculogenesis was seen and the ovaries were depleted of oocyte-containing follicles. In addition, no primordial oocytes were seen.

Example 8

Western Analysis of Antisera Produced by Vaccinated

10

Animals

In an attempt to better understand the immune response and different physiological effects obtained in the two studies described in Examples 6 and 7, antisera produced in each test group was analyzed by Western Analysis against a variety of antigens including natural porcine ZPC, heat-solubilized dog zona pellucida (HSDZ), recombinant dog ZPA and ZPC, and recombinant pig ZPC. Western blots were probed with antiserum obtained from the test animals of Example 6, e.g., animals immunized with isoelectric focused, heat-solubilized porcine zona pellucida, and with antiserum obtained from the two test animals of Example 7 which contained antibodies against self-zona proteins.

The data demonstrate no recognition of recombinant porcine or canine ZPC by antisera from infertile, but cycling dogs immunized with heat solubilized porcine zona pellucida which contained no demonstrable ZPC by PAGE analysis, however, natural ZPC, HSDZ and recombinant canine ZPA were recognized. In contrast, antisera obtained from infertile dogs whose ovaries were depleted of oocytes recognized recombinant ZPC protein, i.e., the polypeptide backbone.

- 31 -

A key difference in the antibody recognition of antigen was that only the antisera obtained from dogs having ovaries devoid of oocytes appeared to recognize the recombinant dog ZPC antigen. Infertile dogs whose antisera strongly recognized natural ZPC, HSDZ, and recombinant dog ZPA
5 demonstrated no recognition of recombinant dog ZPC.

Given that autoimmunity is essential for a contraceptive effect, these data suggest that infertility without histologically evident ovarian dysfunction can be obtained in dogs via an autoimmune response against dog ZPA antigens. In contrast, histologically confirmed ovarian dysfunction, i.e.,
10 loss of oocytes, which would result in permanent sterility, requires the generation of antibodies which specifically recognize homologous species ZPC protein.

Example 9

Expression of Recombinant ZP Proteins

15 I. Construction of Expression Vectors

The plasmid vector pZ90 shown in Fig. 1 was constructed from fragments of the plasmids pUC9 (Vierra & Messing, *Gene* 19:259-268 (1982)) and p β gal2 (Queen, *J. Mol. App. Gen.* 2:1-10 (1983)). The single Pvu II restriction site present in p β gal2 was converted to a Sal I site using a Sal I
20 polylinker adaptor purchased from New England Biolabs. The DNA sequences between the new Sal I site and a pre-existing Sal I site were excised by digestion with Sal I, religated and screened for the reduced size plasmid.

A Cla I - Nde I fragment of the modified p β gal2 plasmid which carried the λ CI repressor gene, the λ pR promoter and the Lac Z gene
25 (β -galactosidase) was inserted into pUC9 between its Acc I and Nde I restriction sites. The pUC9 plasmid carries the ampicillin resistance (Amp^R) gene and col EI replication origin (ori) needed to maintain the plasmid in *E. coli* cells. The combination plasmid was further modified to convert the Bam

- 32 -

HI site 3' of the ATG initiation codon (ATG GAT CCN) to a Bgl II site 5' of the ATG initiation codon (AGATCTATG). This was accomplished by partially digesting the plasmid with Rsa I. One of the several digestion points was about 20 bps 5' of the Bam HI restriction site. When the partially digested plasmid was digested with Bam HI, some of the plasmids produced were nearly full length. A synthetic oligomer (GTACTAAGGAAGATCTATGGATCC) (SEQ ID NO. 29) was produced to replace the sequence that had been removed (GTACTAAGGAGGTTGTATGGATCC) (SEQ ID NO. 30). The net effect of this replacement was the substitution of 3 bps to create the Bgl II restriction site. A DNA fragment containing approximately 3000 base pairs of the Lac Z gene was then excised by restriction digestion with Bgl I and Ban II and was followed by insertion of a synthetic oligomer containing a Bam HI site. The plasmid was cut with Bgl I and Ban II, and then treated with nuclease S1 to create blunt ends. A Bam HI linker (New England Biolabs) was inserted at the blunt ends of the digested plasmid. Next a Pvu II restriction site between the λ CI repressor gene and the ori sequence was converted to a Hind III site using a synthetic linker. The Pvu II restriction site was cut with Pvu II, and a Hind III linker (New England Biolabs) was ligated to the blunted ends. Because the remaining lac Z sequence was missing the first 8 codons of the natural sequence, these 8 codons were replaced by synthesizing a synthetic oligomer that began with a Bgl II site and encoded the lac Z wild type gene product (β gal) N-terminal sequence.

The synthetic oligomer was prepared by synthesizing four oligomers having the sequences set out in SEQ ID NO. 31 (oligomer 1), SEQ ID NO. 32 (oligomer 2), SEQ ID NO. 33 (oligomer 3), and SEQ ID NO. 34 (Oligomer 4). Oligomers 2 and 3 were phosphorylated by treating with kinase and ATP to add phosphate to the 5' end. Oligomers 1 and 2 were then hybridized to oligomers 3 and 4, respectively, by incubation at 100°C followed by a slow cooling in 200 μ M NaCl. The resultant oligomer had the sequence

- 33 -

set out in SEQ ID NO. 35. The synthetic oligomer as set out in SEQ ID NO. 35 had Bgl II-Pvu II ends and was substituted for the Bgl II-Pvu II sequence of the plasmid by restriction digestion of the plasmid and ligation with the oligomer.

5 The resultant plasmid was termed pZ90 and is shown in Figure 1. The plasmid pZ90 can be used to express recombinant proteins by heat induction, using the heat labile λ CI repressor. The heat-inducible repressor and promoter of pZ90 was next replaced with the chemically inducible promoter ptac (Amann *et al.*, *Gene* 25:167-178 (1983)). The ptac promoter
10 is controlled by the lac repressor, a product of the lac I gene (Farabaugh, *Nature* 279:765-769 (1978)). The Lac I gene was obtained from pMC9 (Miller *et al.*, *The EMBO Journal* 3:3117-3121 (1984)) by use of PCR methodology as described by Innis and Gelfand, In: *PCR Protocols: A Guide to Methods and Applications*, Innis, M.A., Gelfand, D.H., Sninsky, J.J. and
15 White, T.J. (eds)., pgs 1-12, Academic Press, Inc., San Diego, CA. The primers used were complimentary to the Lac I promoter at one end and the Lac I gene termination codon at the opposite end. The N-terminal primer carried a Hind III site and the C-terminal primer carried a tac promoter sequence followed by a Bgl II site. The N-terminal primer had the sequence
20 set out in SEQ ID NO. 36. The C-terminal primer had the sequence as set out in SEQ ID NO. 37 which includes a Dra 3 site having the sequence 5'-CACAATGTG-3'. The resulting lac I - ptac DNA fragment having Hind III and Bgl II restriction sites at its respective ends was then used to replace the Hind III - Bgl II fragment of pZ90 which carried the λ CI repressor and λ pR
25 promotor. This replacement yielded the plasmid pZ98 shown in Fig. 2.

II. Insertion of Recombinant ZP DNA

DNA sequences encoding porcine ZPC were prepared by the PCR procedures described above (Innis & Gelfand) from the plasmid pZ57 prepared in Example 1, which contains the full length porcine ZPC sequence

- 34 -

obtained from λ gt11 clone 5-1 described for Example 1. During the PCR procedure the porcine ZPC gene was modified by using primers that did not include the leader sequence and the hydrophobic tail. The N-terminal primer used had the sequence set out in SEQ ID NO. 38 which included an internal
5 Bam HI restriction site having the sequence 5'-GGATCC-3'. The C-terminal primer used had the sequence as set in SEQ ID NO. 39 includes a Sal I restriction site having the sequence 5'-CTCGAG-3' and an internal Xho I restriction site having the sequence 5'-CTCGAG-3'. The modified ZPC gene contained base pairs 105 to 1154 encoding ZPC amino acids 1-350.

10 To the 5' end of the modified porcine ZPC gene was added a Bam HI restriction site, and to the 3' end was added an Xho I site, a Hexa-CAT-codon sequence (CAT)₆, a termination codon, and a Sal I restriction site. This modified porcine ZPC gene was inserted into the Bam HI - Sal I restriction site of pZ98 to yield the porcine ZPC expression vector,
15 plasmid pZ156 shown in Fig. 3. The (CAT)₆ sequence produces a C-terminal hexahistidine (His₆) amino acid sequence in the recombinant fusion protein which permits purification of the fusion protein by immobilized metal in affinity chromatography.

In a similar manner as described above, the plasmid pZ156
20 when digested with Bam HI and Xho I, may be used to receive any other recombinant ZP gene or gene fragment for expression as a β gal fusion protein which can be purified by metal ion affinity chromatography.

III. Expression of Porcine ZPC Fusion Protein in *E. coli*

The expression vector pZ156 (Fig. 3) was transformed into *E.*
25 *coli* strain Top 10F' (Invitrogen, San Diego, CA) by the procedure of Chung *et al.*, *Proc. Natl. Acad. Sci. USA* 86: 2172-2175 (1989). The transformed *E. coli* cell line was termed Strain ZI 156, and was used to express recombinant porcine ZPC- β gal fusion protein.

- 35 -

Bacterial cultures of ZI 156 were grown in Luria Broth (LB) containing 100 μ g/ml ampicillin at 30°C until the cell density reached an OD⁶⁰⁰ of approximately 1.5. Isopropyl beta-D-thiogalactopyranoside (IPTG) (3ml of 100mM solution/ 1 media) was added to induce expression from the tac promoter, and the cells were further incubated at 30°C for 2-3 hours. The cells were harvested by centrifugation, and the resulting cell pellet was frozen at -70°C.

The frozen cell pellets were suspended in 10 mM EDTA (1g/2-2.5 ml) and twice sonicated at 50% power for 3 minutes, cooling in an ice bath between each sonication. The cell lysate was then centrifuged at 3300 x g for one hour and the hard pellet was retained. This lysis procedure was repeated using the hard pellets.

In order to remove residual EDTA, the final hard cellular pellet was dispersed in a small volume of water by a brief burst of sonication, the suspension was centrifuged, and the supernatant discarded. The washed pellet was thoroughly resuspended in Buffer A, (6M guanidine hydrochloride (GuHCl), 100 mM Na H₂PO₄, 10 mM TRIS pH 8, at approximately 0.5 ml per original gram of cell pellet). The suspension was centrifuged at 10,000 x g for 45 seconds and the supernatant was retained while the pellet was discarded.

The retained supernatant was loaded onto a Ni column (in Buffer A) and the column was washed with 10 column volumes of Buffer A. The column was next washed with 5 volumes each Buffers B-D, each containing 8M urea, 100mM NaH₂PO₄, and 10 mM TRIS, and having successively reduced pH values of 8, 6.3, 5.9 for Buffers B, C, and D, respectively. The recombinant pZPC- β gal fusion protein eluted with Buffer E, at pH 4.5 as shown by screening by Western Blot analysis using rabbit anti-HSDZ and anti-HSPZ as probes. Further elution may be accomplished using Buffer F (pH 2.5) (8M GuHCl, 200 mM Acetic Acid).

- 36 -

The fusion protein obtained by this protocol was prepared in its final dose for injection into a host animal by adjusting the final volume to 0.5 ml in 8M urea, and adding it to 0.5 ml adjuvant as described above. Each dose was injected subcutaneously into a test animal.

5

Example 10

Vaccination of Dogs with Recombinant ZPC- β gal Fusion Protein

Eleven mixed breed dogs approximately 5-6 months of age were randomly selected from test animals previously treated at approximately 2 months of age with heat solubilized porcine zona pellucida or chromatographically purified porcine ZP3 β in combination with various biopolymers as adjuvants and drug releasing vehicles. Six weeks post first injection, i.e., three and a half months of age, all test animals had achieved antibody titers versus HSPZ in the range of 2-16K as determined by ELISA. However, none of the test animals achieved antibody titers against self-antigen, e. g., HSDZ.

At 5-6 months of age, five of the test animals were then injected with a loading dose of the porcine ZPC- β gal fusion protein prepared as described for Example 9. The recombinant ZPC- β gal fusion protein produced in Example 9 was adjusted to the desired dose in a final volume of 0.5ml 8M urea and combined with 0.5 ml adjuvant. The adjuvant, N-acetyl-D-glucosaminyl- β (1,4)-N-acetyl muramyl-L-alanyl-D-isoglutamine (GMDP), 250 μ g, was dispersed in 0.42 ml mineral oil, 0.157 ml L-121 block polymers, and 0.02 ml Tween 80. Each dose was injected subcutaneously into the five test animals. The remaining 6 animals were maintained as controls.

- 37 -

Following a total of four injections given at 2-3 week intervals, antibody titers versus self antigen, e.g., HSDZ, were obtained in all test animals, with peaks in the range of 2-8 K as measured by ELISA.

Some of the control animals began to cycle beginning at approximately 9 months of age, and by 11 months of age, 4 of 6 control animals had experienced their first estrus. In contrast, none of the 5 test animals which had received recombinant ZPC- β gal fusion protein had cycled during this same time period. However, although the first estrus was delayed for several months in the test animals, they eventually began to cycle. Two of the five vaccinated dogs became pregnant during their second estrus after immunization while a third dog became pregnant during its third estrus after immunization; however, the two remaining test animals remain infertile through three estrus cycles and nearly two years after vaccination.

Example 11

Isolation of Human DNA Sequences Encoding Human Zona Pellucida Proteins ZPA and ZPB

A human genomic DNA library purchased from Stratagene (catalog no. 946203) was used for the isolation of DNA sequences encoding human ZP proteins. The library consisted of 9-23 kb inserts of human DNA (from placenta tissue of a male caucasian) cloned into the Lambda FixTMII vector (Stratagene). Approximately 40,000 pfus were plated on *E. coli* strain LE 392 (Stratagene, catalog no. 200266), as described in the Stratagene protocol, but replacing MgSO₄ with MgCl₂. After overnight incubation, nylon membrane lifts of the plaques were prepared and screened with ³²P-labelled porcine ZPA cDNA (SEQ ID NO. 1) and with ³²P-labelled porcine ZPB cDNA (SEQ ID NO. 3) as described in Example 2.

Three clones 1-1, 2-2, and 4-9 were shown to hybridize to the porcine ZPB cDNA (SEQ ID NO. 3). Clones 1-1 and 4-9 were deposited

- 38 -

with the American Type Culture Collection, (ATCC) 12301 Parklawn Drive, Rockville, Maryland, on January 27, 1993 under ATCC Accession Nos. 75406 and 75405, respectively. Human DNA inserts were isolated from these clones and analyzed by restriction endonuclease digestion with Eco RI and Southern blot analysis as described in Example 1. Table 4 shows the results of Eco RI digestion of these clones.

Table 4
HUMAN GENOMIC ZPB EcoRI INSERTS

10	CLONES			
	Fragment	1-1	2-2	4-9
	A		2.8 kb	2.8 kb
	B	2.2 kb		
	C	2.0 kb		
	D	1.5 kb		1.5 kb
15	E	0.2 kb		0.2 kb
	F	3.2 kb	3.2 kb	3.2 kb
	G	0.7 kb		

Southern blot analysis revealed four Eco RI fragments which were judged to carry ZPB coding sequences based on hybridization to the porcine ZPB cDNA (SEQ ID NO. 3). Clone 1-1 DNA included a 2.2 kb, 2.0 kb, and 1.5 kb Eco RI fragments which so hybridized. Clone 2-2 DNA included a 2.8 kb Eco RI hybridizing fragment. Clone 4-9 DNA included a 2.8 kb and a 1.5 kb Eco RI fragment which hybridized to the porcine ZPB cDNA probe. All inserts additionally included a 3.2 kb non-hybridizing Eco RI fragment; inserts from clones 1-1 and 4-9 both provided 0.2 kb non-hybridizing fragments; and clone 1-1 additionally provided a 0.7 kb non-hybridizing fragment.

- 39 -

Further restriction analysis revealed the fragment alignment shown in Figure 4. Six of the fragments (A-F) were subcloned into pBSKS for sequence analysis, as described in Example 1. Preliminary sequence analysis confirmed the fragment alignment shown in Figure 4, and suggested
5 that the complete coding sequence of the human ZPB gene may be from clones 1-1 and 4-9. This was confirmed by nucleotide sequence analysis of the inserts, and comparison of the sequences with the feline ZPB sequence (SEQ ID NO. 15) and porcine ZPB sequence (SEQ ID NO. 3). The DNA sequence and deduced amino acid sequences for human ZPB are set out as
10 SEQ ID NO. 40 and 41, respectively.

Clones hybridizing to the porcine ZPA cDNA (SEQ ID NO. 1) under the conditions described in Example 1 were also isolated. Two positive clones, A1 and A4 were identified. The clones were deposited with the American Type Culture Collection, 12301 Parklawn Drive, Rockville,
15 Maryland 20852, on January 27, 1993 under ATCC Accession Nos. 75404 and 75403 respectively. Southern blot analysis revealed that these clones contain all or part of the human ZPA gene. DNA was isolated from these clones and was analyzed by Bgl II, Hind III, and Not I restriction endonuclease digestion and Southern blot analysis as described in Example 1.
20 The size of the A1 clone DNA insert is approximately 11.6 kb, and that of the A4 clone is approximately 13.2 kb. Two of the Bgl II fragments which hybridized with the porcine ZPA cDNA (SEQ ID NO 1) were subcloned into pBSKS for sequence analysis, as described in Example 1. Sequence analysis revealed that A1 and A4 collectively contain the human ZPA gene as
25 supported by comparison to sequences with the porcine ZPA cDNA (SEQ ID NO. 1) and the canine ZPA cDNA (SEQ ID NO. 11). The complete DNA sequence and the deduced amino acid sequence are set out as SEQ ID NOS. 42 and 43, respectively.

- 40 -

Example 12**Isolation and Sequencing of DNA Encoding
Cynomolgus Monkey ZPA, ZPB, and ZPC**

Cynomolgus monkey cDNA libraries were constructed in λ gt10 as described below. Briefly, a set of ovaries were collected from two female cynomolgus monkeys aged 1.5 years and 2 years, and a second set from three females aged 3 years, 4 years, and 14 years of age. Messenger RNA was isolated using the Fast Track™ mRNA isolation kit following the manufacturer's instructions. The cDNA was prepared using the Lambda Librarian™ (Invitrogen, as described in Example 2) kit following the protocol provided with the kit. The cDNA was packaged into lambda phage heads using the Proclone® (Promega, Madison, WI) λ gt10 *EcoRI* arms plus the Packagene® (Promega) lambda DNA packaging system following the manufacturer's instructions. This procedure generally produced libraries with a titer of greater than 1×10^6 pfu/ml. The monkey cDNA library was then screened using porcine ZPA, ZPB, and ZPC probes isolated from the porcine cDNA as described in Example 1. Screening was accomplished by preparing duplicate plaque lifts using Nytran® nylon filters (0.2 μ M pore size). The filters were prehybridized in a solution of 5x SSPE (43.83 g/l of NaCl, 6.9 g/l of NaH_2PO_4 , H_2O , 1.85 g/l of EDTA, pH 7.4), 5x Denhardt's Reagent (1 g/l of Ficoll [type 400], 1 g/l of polyvinylpyrrolidone and 1 g/l bovine serum albumin), 100 μ g/ml sonicated, denatured salmon sperm testes DNA, 30% formamide, and 0.5% SDS, for 3 hrs. at 42°C. Radio-labelled probes were prepared using [α - ^{32}P] -dATP and the Prime-a-Gene® (Promega) labelling system. After prehybridization, 10 ng of freshly radio-labelled probe was heat denatured at 95°C for 5 minutes in 50% formamide and 100 μ g/ml sonicated, denatured salmon testes DNA, and was added to the filters. The hybridization was carried out at 42°C for 15-24 hours. The hybridized filters were then washed twice with 100 ml of 5X SSPE at 55°C, for approximately one hour

- 41 -

each wash. The filters were then rinsed in 250 ml of 5X SSPE at 55°C and allowed to air dry. The dried filters were exposed to x-ray film (Kodak XAR5, Eastman Kodak, Rochester NY) at -70°C using two intensifying screens (Kodak X-OMATIC™) for at least eight hours. The film was then
5 developed for visual analysis.

Exhaustive screening of the two cynomolgus monkey ovarian cDNA libraries using all of the porcine probes yielded a total of 12 candidate clones. Southern hybridization revealed that only one of these clones (λ CM 4-2) hybridized to the porcine ZPA probe. This clone contained an insert of
10 560 bp. Sequencing of the insert was performed using the Sequenase® Version 2 kit (U.S. Biochemicals, Cleveland, Ohio) according to the manufacturer's instructions. Sequencing revealed that the 560 bp insert was homologous to the 3' end of other mammalian ZPA genes. The 560 bp fragment represents just under 25% bp of the full-length sequence and
15 contains an open reading frame of 492 bp which would encode a protein of 164 amino acids. The DNA sequence and the deduced amino acid sequence of the cynomolgus monkey ZPA cDNA is set out as SEQ ID NOS. 44 and 45, respectively.

Exhaustive screening of the cynomolgus monkey ovarian cDNA
20 libraries with the porcine ZPB probe yielded a single ZPB candidate clone having an insert of 866 bp. Sequence analysis suggests that the insert includes the C-terminal 50% of the expected full-length sequence. The DNA sequence and deduced amino acid sequence of the monkey ZPB insert are set out as SEQ ID NOS. 46 and 47, respectively. Screening of monkey ovarian cDNA
25 libraries with the porcine ZPC DNA probe yielded only partial ZPC clones, the largest (λ CM1-1) having an insert of approximately 1300 bp which contains just over 50% of the C-terminal portion of the full-length sequence based on comparison to known ZPC clones, (particularly the human ZPC clone). The clone contains an open reading frame of 672 bp which would
30 encode a protein of 224 amino acids. The clone also contains stop codons

- 42 -

immediately 5' to the coding sequence in all three reading frames. The DNA sequence and the deduced amino acid sequence of the cynomolgus monkey ZPC clones are set out as sequence ID NOS 48 and 49 respectively.

Example 13

5 **Comparison of ZPA DNA and Deduced Amino Acid Sequences**

Table 5 shows a comparison of the DNA and deduced amino acid sequence of mammalian ZPAs.

TABLE 5
ZPA HOMOMOLOGY

	PROTEIN HOMOMOLOGY							
	Mouse	Rabbit	Pig	Cow	Dog	Cat	Monkey	Human
Mouse	--	61.0%	54.2%	60.8%	57.9%	56.9%	57.2%	58.9%

DNA HOMOMOLOGY

- 44 -

Data is presented as a cross-wise comparison of the ZPA protein and DNA sequences. The comparison of the protein sequences are shown in the upper right hand side of the table, above the diagonal dashed lines. The comparison of the DNA sequences are shown in the lower left hand side of the table, below the diagonal dashed lines. The ZPA DNA and deduced amino acid sequences are highly homologous between species. The homology is highest between members of the same order within the class *mammalia*. For example, the human and cynomolgus monkey (*primata*), the pig and cow (*ungulata*), and the cat and dog (*carnivora*) sequences have the most similarity. The high degree of homology between the ZPA genes, as well as between the ZPB (see Example 14) and ZPC (Example 15) genes from a variety of mammalian species, implies a great deal of structural similarity in the ZP layers of these species. However, post-translational modification differences such as glycosylation and others, could represent a potential source of variation.

One protein processing site that all of these ZPA proteins have in common is a furin cleavage site (R-X-R/K-R; Hosaka *et al. J. Biol. Chem.*, 266:12127 (1991)) near the C-terminal end of the protein. In fact, with only a few exceptions, all ZP proteins contain a furin processing site near the C-terminus. This furin site could serve to cleave off a putative membrane anchor sequence which would allow the processed proteins to move toward the outer edge of the growing ZP layer.

The human ZPA gene contains an exon near the 3' end that is present in the cynomolgus monkey ZPA sequence, but not present in the ZPA genes from other species. This extra exon codes for an amino acid sequence that occurs after the furin processing site, which suggests that the C-terminal fragment generated by furin cleavage might still be important to the function of the ZP layer or to the oocyte in some way.

There are 20 conserved cysteine residues and one or two non-conserved cysteine residues in each of the full-length ZPA sequences. The

- 45 -

non-conserved cysteine residues occur either in the N-terminal leader sequence region, or in the extreme C-terminal region of the sequence, where a large amount of the variation between the ZPA sequences occurs. The high degree of homology and the large number of conserved cysteine residues suggests that the tertiary structures of the ZPA proteins are similar.

It has been noted previously that there are regions of homology between the ZPA and ZPB class proteins (Schwoebel *et al. J. Biol. Chem.*, 266:7214 (1991); Lee *et al. J. Biol. Chem.*, 268: 12412 (1993); Yurewicz *et al. Biochem. Biophys. Acta* 1174:211 (1993)). Comparison of the human ZPA genomic structure with the human ZPB genomic structure shows these regions to be confined to exons 12, 13, and 14 of the human ZPA gene and exons 5, 6, and 7 of the human ZPB gene. This suggests that this homology might be due to a partial ancestral gene duplication. The ZPB proteins contain 21 conserved cysteine residues. The first 11 of these do not align with those in the ZPA proteins, but the last 10 match well. This extends the homology to approximately 270 amino acids, covering exons 11-16 of the ZPA gene and exons 4-9 of the ZPB gene, although the overall homology of the expanded region is slightly lower (approximately 43%). The remainder of the ZPA and ZPB genes show very little homology with each other, and the ZPC genes also show no extensive homology to the ZPA genes. In addition, the ZPA gene has no extensive sequence similarity to non-ZP nucleic acid and protein sequences in Genbank and the SwissProt data banks.

Example 14

Comparison of ZPB DNA and of Deduced Amino Acid Sequences

Table 6 shows the comparison of the six known ZPB DNA and protein sequences (the bovine and cynomolgus cDNA fragments are only compared to the corresponding regions of the other full-length ZPB sequences).

TABLE 6

ZPB HOMOLOGY

PROTEIN HOMOLOGY

	Rabbit	Bovine	Porcine	Feline	C. Monkey	Human
Rabbit	--	75.3%	65.3%	60.1%	70.2%	65.2%
Bovine	78.8%	--	82.3%	71.2%	69.9%	69.6%
Porcine	74.2%	86.2%	--	63.7%	63.6%	63.1%
Feline	69.5%	78.7%	72.9%	--	70.3%	64.6%
C. Monkey	78.9%	78.5%	78.2%	78.6%	--	92.3%
Human	74.3%	80.8%	73.3%	74.2%	95%	--

DNA HOMOLOGY

- 47 -

The data are presented as cross-wise comparison of the ZPB protein and DNA sequences. The comparison of the protein sequences are shown in the upper right hand side of the table, above the diagonal dashed lines. The comparison of the DNA sequences are shown in the lower left hand side of the table, below the diagonal dashed lines.

The data shows considerable ZPB homology among members of different mammalian species. As was the case with ZPA, this homology is most pronounced between members of the same order within the class *mammalia*. For example, the human and cynomolgus monkey sequences (*primata*) and the pig and cow sequences (*ungulata*) have the most homology to each other. With only a few exceptions (noted below), the ZPB sequences show no homology to other DNA or protein sequences in the GenBank or SwissProt databases. Hybridization experiments suggest that the ZPB transcripts are ovary specific.

Comparisons of the deduced amino acid sequences of the ZPB clones show more divergence within this genetic group than within the ZPA and ZPC groups. Comparison of the rabbit ZPB and porcine ZPB shows the sequences to be predominantly collinear (74% homologous) except that the rabbit has an additional upstream ATG codon which adds six codons to the rabbit sequence.

The feline ZPB sequence has two additional amino acid inserts, which total 38 additional codons, in the first quarter of the gene, compared to the porcine and rabbit sequences. Both inserts occur just after cysteine residues, which suggests that if the cysteines are involved in disulfide bridges, these regions might form unique epitopes. However, the feline gene is still 73% homologous to porcine gene and 70% homologous to the rabbit gene.

The human gene has a sequence homologous to the first of the inserts in the cat sequence, but not the second. However, there are consensus splice site donor and acceptor sequences adjacent to this extra region in the human sequence, which if used would leave the coding sequence in frame.

- 48 -

Therefore, the sequence representing exon 2 could actually be two small exons (122 and 103 bp) separated by a small intron (84 bp). This would make the human sequence in this region identical to the pig sequence. The first extra region in the cat sequence is also flanked by in frame splice site donor and acceptor signals. If the extra region was removed from the cat sequence, it would differ from the pig sequence by only a single amino acid. However, the cat sequence was obtained from a cDNA clone made from an mRNA that appears to be fully processed. The second extra region in the cat sequence does not contain in frame splice site donor or acceptor signals, and therefore is probably not due to the presence of an unprocessed intron.

The cynomolgus monkey and human sequences have an additional seven codons at the C-terminus when compared to the other ZPB sequences. In the cynomolgus monkey, this is due to a two-base pair deletion, which causes a frameshift mutation which puts the termination codon used by the other species out of frame. The human sequence also contains this deletion, but in addition, there is also a base change that eliminates this termination codon.

There are 21 conserved cysteine residues in the ZPB proteins, the final 10 of which occur in a region that has homology to the ZPA proteins. This homology was noted previously (Schwoebel *et al.*, *supra*; Lee *et al.* *supra*, 1993; Yurewicz *et al.* *supra*, 1993), but examination of the genomic structure of the human ZPA and ZPB genes allowed the homology to be extended to approximately 270 amino acids. This homology could be due to a partial ancestral gene duplication. In addition to the conserved cysteine residues, the pig ZPB protein contains one additional cysteine residue in the putative leader sequence, and the human sequence contains four additional cysteine residues. The first of these is in the putative leader sequence (in a different location than pig), the second is in the region containing the additional insert, and the last two are in the C-terminal

- 49 -

extension caused by the mutated termination codon. These last two extra cysteine residues are conserved in the cynomolgus monkey sequence.

All of the ZP proteins contain a putative transmembrane domain near the C-terminus. However, the canonical furin proteolytic processing
5 signal (R-X-R/K-R, Hosaka *et al. supra*, 1991), which occurs just prior to the transmembrane domain in all of the ZPA and ZPC proteins, is altered in the human (S-R-R-R), cynomolgus monkey (S-R-R-N) and rabbit (S-R-R-R) ZPB
10 sequences. The significance of this is unknown, but it may indicate that these proteins are processed by a related system with specificity for di- or tribasic sequences, since the release of the putative transmembrane domain would be
necessary for the ZPB protein to move as the ZP layer grows. There appears to be a great deal of proteolytic processing of the pig ZPA and ZPB
(Yurewicz *et al. supra*,) proteins. There is no data concerning the post-translational modification of the ZPB proteins of cat, cow, cynomolgus
15 monkey or human. The physiologic significance of this processing is unknown, but differential processing would present an avenue of variation among species of the highly conserved ZP proteins.

There is a question of whether humans actually transcribe the ZPB gene. Since the amount of human ovarian mRNA recovered was so
20 small, there was not enough RNA to both construct a cDNA library and perform a Northern analysis. However, since cynomolgus monkey transcribes the ZPB gene, it is probable that the highly homologous human ZPB gene is also transcribed.

The apparent lack of a ZPB cDNA in the dog cDNA library is
25 another puzzle. All of the libraries screened which contained any zona pellucida gene contained all three genes, except the dog. However, mRNA isolated from the ovary of a six-month old dog (the library was made from the ovary of a four-month old dog), includes a ZPB mRNA that comigrates with the porcine and cynomolgus monkey ZPB mRNA on a Northern blot. One
30 possibility to explain the lack of a canine ZPB cDNA is that the transcriptional

- 50 -

timing of the three ZP genes is spread out, and since the ovary used to make the library was young, the transcription of the ZPB gene occurs later than the ZPA and ZPC genes (Andersen and Simpson, 1973).

Example 15

5 Comparison of ZPC DNA and Deduced Amino Acid Sequences

Table 7 shows the comparison of the DNA and deduced amino acid sequences from all of the ZPC cDNAs and genes.

TABLE 7

ZPC HOMOLOGY

PROTEIN HOMOLOGY

DNA HOMOLOGY

- 52 -

The data are presented as a cross-wise comparison of the ZPC protein and DNA sequences. The comparison of the protein sequences are shown in the upper right hand side of the table, above the diagonal dashed lines. The comparison of the DNA sequences are shown in the lower left hand side of the table, below the diagonal dashed lines.

ZPC proteins and DNA sequences show a higher degree of homology than the ZPA and ZPB DNAs and proteins. As was the case with ZPA and ZPB, the homology is most pronounced in members of the same order within the class *mammalia*; the human and cynomolgus monkey sequences (*primata*), the cat and dog sequences (*carnivora*), the pig and cow sequences (*ungulata*), and the mouse and hamster sequences (*rodenta*). The ZPC transcripts are ovary specific, based on Northern blot analysis and comparison to the sequences in the GenBank and SwissProt databases detects no significant non-ZP homology. Comparison of the deduced amino acid sequences of the known ZPC genes detects three regions that contain large numbers of non-consensus sequences. These regions are: the putative leader sequences and the first 20-25 amino acids of the mature protein; the region containing the peptide that was identified as a sperm-binding region in the mouse (Millar *et al. Science* 216:935-938 (1989)); and the C-terminal region of the proteins that might be removed from the mature protein at the furin processing site (see below).

The epitope identified as a putative sperm-binding site (Millar *et al. supra*, 1989) occurs immediately before a furin proteolytic cleavage site (Hosaka *et al.*, 1991). The furin site (R-X-R/K-R) is highly conserved in all of the ZPC sequences. However, it should be noted that the canine ZPC sequence contains a second furin site, 19 amino acids upstream from the first furin site. Also as is the case with ZPA and ZPB, cleavage by furin of the ZPC proteins would remove a putative membrane anchor sequence (Klein *et al.*, 1985), which would allow the processed ZPC protein to move toward the outer layer of the expanding oocyte. Therefore, this sperm-binding site

- 53 -

probably represents the C-terminus of the mature proteins. However, there is very little homology (even between hamster and mouse) in the regions of the ZPC proteins corresponding to this epitope. This might indicate that this region contributes to the species specificity of sperm-egg binding.

5 The variation that is seen at the C-terminus of the ZPC proteins occurs in the putative transmembrane region. This variation could indicate that this amino acid sequence is less important than the overall hydrophobicity of the amino acids in this region, similar to the lack of homology seen in leader sequences. However, it is also possible that this variation signifies a
10 species-specific function for this region.

Each ZPC sequence contains 14 conserved cysteine residues, but each sequence also has one or two extra cysteine residues that are shared only with one or a few other sequences. These extra cysteine residues are near the N- or C-terminus of the proteins, where the greatest sequence
15 variation exists. However, the large number of conserved cysteine residues probably indicates that the overall structure of the central core of all of these proteins is quite conserved.

Example 16

Immunization of Cynomolgus Monkeys With HSPZ

20 A sexually mature cynomolgus monkey was immunized with HSPZ to test the ability of HSPZ to induce infertility. HSPZ was prepared as described in Example 6. HSPZ was mixed with the following GMDP/oil adjuvant. 50 μ g GMDP (N-acetyl-D-glucosaminyl-(β 1-4)-N-acetylmuramyl-D-isoglutamine) (CC. Biotech, Poway, CA); 42.1 of mineral oil, 15.8% pluronic
25 VC-121 (block polymer polyols, BASF-Wyandotte, Parsippany, NJ). The animal received a series of 4 subcutaneous injections of 1 mg of HSPZ in the GMDP/oil adjuvant beginning with a priming dose followed four weeks later by a booster dose, which was followed by two booster doses five weeks apart

- 54 -

which were followed six weeks later by a final dose. This dosage regimen resulted in an anovulatory monkey having antibody titers against its cynomolgus monkey heat-solubilized zona pellucida prepared as described for HSPZ. The peak antibody titers to cynomolgus monkey HSPZ were 1:8000-
5 1:16,000.

A fractionated preparation of HSPZ which is essentially native porcine ZPA and ZPB was prepared by isoelectric focusing, as described in Example 6 and was used to vaccinate cynomolgus monkeys using 1 mg of fractionated HSPZ in GMDP/oil injected subcutaneously according to the
10 following schedule: a priming dose was given followed approximately 6 weeks later by a booster dose followed by a final booster dose 11 weeks after the previous booster dose. The immunized monkeys achieved peak antibody titers of 1:4,000-1:8,000 against monkey heat-solubilized zona pellucida while maintaining a regular ovulatory cycle. However, despite maintaining a
15 regular ovulatory cycle, the monkeys remained infertile until their antibody titers to monkey heat-solubilized zona pellucida fell below 1:500 after which the animals became pregnant upon breeding.

Immunization of cynomolgus monkeys with recombinant baculovirus produced canine ZPC and porcine ZPC (prepared as described in
20 Example 18) failed to induce infertility despite inducing antibody production against monkey heat-solubilized zona pellucida. One possible explanation for this is that the glycosylation pattern of ZP proteins produced in the baculovirus system may prevent recognition of the epitopes responsible for induction of infertility.

25 Bacterially produced porcine ZPA, ZPB, and ZPC described above administered to cynomolgus monkeys failed to induce detectable antibody titers against cynomolgus monkey heat-solubilized zona pellucida even though antibody titers against the presented antigens were produced.

- 55 -

Example 17**Mapping of Mammalian Zona Pellucida Protein Epitopes**

A Pin Technology™ Epitope Scanning Kit purchased from Chiron Mimotopes U.S., Emeryville, CA (Catalog No. PT-02-20000A) was
5 used for mapping epitopes in Zona Pellucida proteins. The procedures described in the kit manual were followed, with the exception of modifications in the ELISA testing procedure (described below).

Briefly, Pin Technology software was installed in a United Business Machines 486/33 computer according to the manufacturer's
10 instructions. The protein sequence was entered into the computer program, the desired peptide length, and degree of overlap between peptides were selected, and a protocol containing the daily requirements of activated protected amino acid derivatives and their location in the coupling tray wells was printed. Prior to use, the pins were first washed once with
15 dimethylformamide (DMF), and then with methanol three times, each wash lasting for two minutes. The pin block was air dried and the pins were deprotected by agitation in a 20% mixture of piperidine in DMF at room temperature for 30 minutes. The pins were washed again as described above, except that the washes were for 5 minutes each, and the pin block was then
20 air dried. The required amino acid derivative solutions were prepared and dispensed into the wells of the synthesis tray according to the protocol for the current cycle. The dried mimotope pins were washed once more in a DMF bath for 5 minutes and then positioned appropriately in the wells of the synthesis tray. The assembly was then sealed in a plastic bag and incubated
25 at 30°C for approximately 22 hours. On the following day, the pin block was removed from the coupling tray and subjected to the same cycle of washing, deprotection, and coupling steps as outlined above; however, using the amino acid derivatives and their tray location appropriate to the next cycle. The

- 56 -

foregoing cycle of washing, deprotection, washing, and coupling was repeated until the peptide sequences were completed.

After coupling the terminal amino acids of the peptides, the pin block was washed, air dried, deprotected, washed and air dried as before.

5 The terminal amino groups of the peptides were then acetylated by immersion of the pins in a mixture containing 5 parts DMF, 2 parts acetic anhydride, and 1 part triethylamine, by volume, dispensed in the wells of a polypropylene coupling tray, and incubating at 30°C for 90 minutes. The pin block was removed, subjected to another washing sequence as before, and air dried.

10 Side chain deprotection of the peptides was performed by agitating the pin block in a mixture containing 95 parts trifluoroacetic acid, 2.5 parts anisole, and 2.5 parts ethanedithiol, by volume, at room temperature for 4 hours. The pin block was then air dried for approximately 10 minutes, sonicated in a bath containing 0.1% hydrochloric acid in a mixture containing
15 equal parts of methanol and deionized water, by volume, for 15 minutes, and finally air dried.

Prior to ELISA testing, the pins were subjected to a disruption procedure involving sonication in a bath consisting of a mixture containing 39 parts sodium dihydrogen orthophosphate, 25 parts sodium dodecyl sulfate, 0.1
20 part 2-mercaptoethanol, and 2500 parts deionized water, by weight, adjusted to pH 7.2 with 50% sodium hydroxide solution. The sonication was performed at 55 to 60°C for approximately 45 minutes. The pin block was then washed by immersion with gentle agitation in three sequential baths of deionized water at 60 degrees for three minutes each. Finally, the pin block
25 was immersed in gently boiling methanol for approximately 4 minutes and then air dried.

Preparation of Antisera

Antisera directed against zona pellucida proteins was prepared by immunizing the appropriate animals with the appropriate zona pellucida

- 57 -

protein using procedures well known in the art and described in E. Harlow and D. Lane in *Antibodies, A Laboratory Manual*, Chapter 5, Cold Spring Harbor Laboratory, 1988 which is incorporated herein by reference. Biotinylated antisera was prepared by a modification of the procedure described in Harlow *supra* (page 314). Briefly, to a solution containing between 1 and 3 mg per ml of the selected antibody IgG fraction in phosphate buffer with saline (PBS) at pH 7.2 was added a solution containing 25 to 250 micrograms biotinamidocaproate, N-hydroxysuccinimide ester (Sigma, Cat No. B2643) in dimethyl sulfoxide at a concentration of 10 mg/ml. The mixture was mixed well and then incubated at room temperature for 4 hours. One molar ammonium chloride solution in the amount corresponding to 20 microliters per 250 micrograms biotin ester was added, and the resulting mixture was incubated at room temperature for 10 minutes. Unreacted biotin ester was then removed by extensive diafiltration with PBS using a Centricon-30 (TM) microconcentrator devices (Amicon Division, W.R. Grace & Co., Inc., Beverly MA). The dilution factor for the resulting conjugate was determined by ELISA titration against the appropriate native protein.

ELISA Testing

A modification of the procedure described in the Epitope Scanning Kit manual was employed.

After disruption, the mimotope pins were blocked by incubation with "supercocktail" (10 g ovalbumin, 10 g bovine serum albumin, and 1 ml Tween 20 detergent per liter of PBS) at room temperature for 1 hour. This was followed by incubation at room temperature for 2 hours with appropriately diluted biotinylated antisera. The pins were washed 4 times with PBS containing 0.5% Tween 20 (PBST) at room temperature for 10 minutes each time, with agitation.

The pins were then incubated at room temperature for 1 hour with the secondary antibody, horseradish peroxidase-streptavidin conjugate

- 58 -

(Zymed Laboratories, Inc., South San Francisco, CA) diluted 1:2500 with PBST. They were washed again as described above.

Substrate buffer was prepared by combining 200 ml 1.0 M. disodium hydrogen orthophosphate solution with 160 ml 1.0 M. citric acid solution, diluting the mixture with 1640 ml deionized water, and adjusting to pH 4.0 using either citric acid or sodium hydroxide solutions. Substrate solution was prepared by dissolving 10 mg 2,2'-azino-bis(3-ethylbenzthiazoline-6-sulfonic acid) diammonium salt in 20 ml substrate buffer and adding 6 microliters 30% hydrogen peroxide. The mimotope pins were incubated at room temperature with this solution, using microtiter plates containing 150 microliters per well. When color development appeared to be appropriate for measurement by an ELISA plate reader, the pin block was removed and the plate was read at a wavelength of 450 nm. The pin block was then disrupted by the procedure described above.

The data were entered into the Pin Technology™ computer program, which performed statistical analysis and evaluation and furnished a print-out of the results identifying the strongest binding epitopes. Briefly, the 25% of the wells having the lowest optical density readings were assumed to represent background in each experiment. The mean value and the standard deviation of these readings were calculated. Significant recognition of peptides by antisera was attributed to the pins corresponding to those wells showing absorbance readings greater than the sum of the background mean and three standard deviations from the mean.

Human ZPA epitopes were examined for reactivity with mouse anti-human ZP antiserum prepared as described above. Peptides of 15 amino acids in length were synthesized beginning with amino acid number 1 as illustrated in SEQ ID NO. 43. Successive peptides having a 7-amino acid overlap with the preceding peptide of the series were synthesized. The following peptides were shown to bind mouse anti-human ZP antiserum: 1-15, 9-23, 25-39, 33-47, 65-79, 81-95, 89-103, 97-111, 105-119, 113-127,

- 59 -

121-135, 129-143, 145-159, 153-167, 161-175, 193-207, 209-223, 217-231,
225-239, 241-255, 249-263, 273-287, 281-295, 289-303, 305-319, 313-327,
321-335, 329-343, 337-351, 345-359, 385-399, 393-407, 401-415, 409-423,
417-431, 425-439, 441-455, 449-463, 457-471, 481-495, 489-503, 497-511,
5 505-519, 513-527, 521-535, 537-551, 545-559, 561-575, 569-583, 577-591,
585-599, 601-615, 609-623, 617-631, 625-639, 633-647, 641-655, 665-679,
697-711, 705-719, 713-727, 721-735, and 729-743.

Similarly, human ZPB epitopes were mapped using mouse anti-human ZP antiserum. In these experiments, 15 amino acid peptides were
10 synthesized beginning with amino acid number 1 as set out in SEQ ID NO. 41. The overlap between successive peptides in this case was 9 amino acids. The following peptides were shown to bind mouse anti-human ZP antiserum:
7-21, 25-39, 31-45, 49-63, 67-81, 73-87, 79-93, 91-105, 103-117, 121-135,
193-207, 205-219, 211-225, 217-231, 223-237, 229-243, 253-267, 259-273,
15 265-279, 283-297, 289-303, 295-309, 301-315, 307-321, 313-327, 319-333,
343-357, 349-363, 355-369, 367-381, 373-387, 379-393, 385-399, 403-417,
409-423, 415-429, 421-435, 433-447, 439-453, 445-459, 451-465, 481-495,
487-501, 499-513, 505-519, 511-525, 523-537, 529-543, and 547-561.

Human ZPC epitopes were mapped using mouse anti-human ZP
20 antiserum. In these experiments, the 15 amino acid peptides were synthesized beginning with amino acid number 1 as set out in Chamberlin *et al.*, *Proc. Nat'l Acad. Sci. USA* 87:6014-6018 (1990) which is incorporated herein by reference. The overlap between successive peptides was 10 amino acids. The following peptides were shown to bind mouse anti-human ZP antiserum:
25 35, 51-65, 116-130, 146-160, 151-165, 181-195, 241-255, 251-265, 271-285,
296-310, 321-335, 401-415, and 411-425.

Canine ZPC epitopes were mapped using rabbit anti-canine ZP antiserum. In these experiments, the 15 amino acid peptides were synthesized beginning at amino acid number 1 set out in SEQ ID NO. 10. The overlap
30 between successive peptides was 5 amino acids. The following peptides were

- 60 -

shown to bind rabbit anti-canine ZP antiserum: 51-65, 61-75, 81-95, 131-145, 181-195, and 301-315.

Feline ZPC epitopes were mapped using rabbit anti-feline ZP antiserum. In these experiments, the 15 amino acid peptides were synthesized beginning at amino acid number 1 as set out in SEQ ID NO. 18. The overlap between successive peptides was 5 amino acids. The following peptides were shown to bind rabbit anti-feline ZP: 36-50, 46-60, 56-70, 76-90, 96-110, 106-120, 116-130, 126-140, 136-150, 146-160, 156-170, 186-200, 196-210, 246-260, 266-280, 276-290, 286-300, 296-310, 316-330, 326-340, 336-350, 346-360, 376-390, 396-410, and 406-420.

Bovine ZPC epitopes were mapped using rabbit anti-bovine ZP antiserum. In these experiments, the overlapping 15 amino acid peptides were synthesized beginning at amino acid number 1 as set out in SEQ ID NO. 24. The overlap between peptides was 10 amino acids. The following peptides were shown to be reactive with rabbit anti-bovine ZP antiserum: 1-15, 31-45, 51-65, 56-70, 61-75, 76-90, 106-120, 111-125, 116-130, 121-135, 131-145, 136-150, 141-155, 146-160, 151-165, 161-175, 181-195, 186-200, 191-205, 196-210, 201-215, 206-220, 216-230, 226-240, 241-255, 246-260, 261-275, 266-280, 271-285, 276-290, 291-305, 296-310, 301-315, 316-330, 321-335, 326-340, 331-345, 336-350, 341-355, 356-370, 361-375, 376-390, 381-395, 386-400, 396-410, 401-415, and 406-420.

Example 18

Immunization of Dogs with Recombinant ZPC Proteins

Dogs were immunized with various preparations of recombinant canine ZPC. The plasmid pZ169 bacterial expression vector (Figure 5) was constructed as follows. The parent vector pZ98 (described in Example 9) was digested with the restriction enzymes *PvuI* and *Bam* HI, and the large

- 61 -

fragment was gel purified. Into this vector was ligated a fragment created by annealing the following oligonucleotides:

5' CGCCCTTCCCAGCAACTGCACCATCACCACCATGGG 3'
(SEQ ID NO. 50); and

5' GATCCCCATGGTGGTGGTGGTGGTGCAGTTGCTGGGAAGGGCGAT 3'
(SEQ ID NO. 51).

These oligonucleotides create a fragment with *PvuI* and *BamHI* ends, and codes for the hexapeptide sequence His₆. This intermediate vector was digested with the restriction enzymes *BamHI* and *EcoRI*, and the large
10 fragment was gel purified. Into this vector was ligated a fragment created by annealing the following oligonucleotides:

5' GATCCCTCGAGCCACCATCACCACCATCATG 3'
(SEQ ID NO. 52); and

15 5' AATTCATGATGGTGGTGGTGGTGGCTCGAGG 3'
(SEQ ID NO. 53).

These oligonucleotides create a fragment with *BamHI* and *EcoRI* ends and an *XhoI* site just downstream of the *BamHI* site, and which codes for the hexapeptide sequence His₆. This new vector was named pZ88, and contains unique *BamHI* and *XhoI* cloning sites between two His₆ sequences. To create
20 pZ169, the pZ88 vector was digested with the restriction enzymes *BamHI* and *XhoI*, and the large fragment was gel purified. Into this vector was ligated a fragment generated by performing a PCR (polymerase chain reaction) of the canine ZPC cDNA using the following oligonucleotides:

- 62 -

5' CCCGGATCCGCAGACCATCTGGCCAACTGAG 3'
(SEQ ID NO. 54); and

5' GCGCTCGAGGGCATATGGCTGCCAGTGTG 3'
(SEQ ID NO. 55).

5 This PCR creates a fragment containing amino acids 23-207 of the canine ZPC sequence, with *Bam*HI and *Xho*I ends. This new vector is named pZ169, (Figure 5) and produces a protein containing amino acids 1-56 of the *E. coli* β -galactosidase sequence, His₆, amino acids 23-207 of the canine ZPC sequence, His₆, and amino acids 1006-1023 of the *E. coli* β -galactosidase
10 sequence. This protein is referred to as N-terminal canine ZPC. In Figure 5, pTAC refers to the tac promoter described above; AmpR refers to an ampicillin resistance marker, ori is an *E. coli* origin of replication sequences and pLacI is the lacI promoter which drives expression of the lacI gene.

Recombinant canine ZPC was produced and purified as
15 described in Example 9. A baculovirus expression vector pZ145 was constructed as follows. The parent vector pBlueBac2 (purchased from Invitrogen Corporation, San Diego, CA) was digested with the restriction enzymes *Nhe*I and *Bam*HI, and the large fragment was gel purified. Into this vector was ligated a fragment generated by a PCR of the porcine ZPC cDNA
20 using the following oligonucleotide:

5' CGCGCTAGCAGATCTATGGCGCCGAGCTGGAGGTTC 3'
(SEQ ID NO. 56); and

5' CGCGGATCCTATTAATGGTGGTGATGGTGGTGACTAGTGGACCCCTTCCA 3'
(SEQ ID NO. 57).

25 This PCR creates a fragment with *Nhe*I and *Bam*HI ends, and contains amino acids 27-350 of the porcine ZPC sequence followed by an *Spe*I site and the hexapeptide His₆. This new vector is named pZ147. To create the pZ145 vector, pZ147 is digested with *Nhe*I and *Spe*I and the large fragment is gel purified (this removes the pig ZPC sequence). Into this vector was ligated a

- 63 -

fragment generated by a PCR of the canine ZPC cDNA using the following oligonucleotides:

5' CCCGCTAGCAGATCTATGGGGCTGAGCTATGGAATTTTC 3'
(SEQ ID NO. 58); and

5' CGCACTAGTTGACCCCTCTATACCATGATCACTA 3'
(SEQ ID NO. 59).

This PCR creates a fragment with *NheI* and *SpeI* ends, and contains amino acids 1-379 of the canine sequence. Transformants of this ligation were screened for the presence of the inserted *NheI/SpeI* fragment in the correct orientation (since the *NheI* and *SpeI* sticky ends are identical). This new vector is named pZ145, (Figure 6) and produces a protein containing amino acids 1-379 of the DZPC sequence followed by His₆. This protein is referred to as baculo-canine ZPC. In Figure 6, pP represents the baculovirus polyhedrin promoter, AmpR represents an ampicillin resistance marker, LacZ represents the gene for β -galactosidase, pE is a constitutive promoter which drives the expression of LacZ and ori is the *E. coli* origin of replication.

Recombinant baculovirus derived canine ZPC was produced by co-transfecting insect SF9 cells with pZ145 and *Autographica californica* multiply enveloped nuclear polyhedrosis virus (AcMNPV) using methods well known in the art as described in the MAXBAC™ kit purchased from Invitrogen, San Diego, CA. Recombinant canine ZPC produced in SF9 cells was prepared from cotransfected SF9 cells as follows. Cotransfected cells were harvested and pelleted by centrifugation and recombinant canine ZPC was purified as was described in Example 9 for purification from a cell pellet. Recombinant canine ZPC may also be isolated from the culture medium and purified on a Ni-column as described in Example 9.

Other expression vectors which are capable of expressing zona pellucida encoding nucleotide sequences under the control of a variety of

- 64 -

regulatory sequences are within the scope of the present invention and are readily constructed using methods well known in the art.

Recombinant zona pellucida proteins may also be modified to increase their potential antigenicity by a variety of methods well known in the art. For example, a recombinant dog ZPC was modified by palmitylation was prepared as follows. Approximately 1 mg of recombinant ZPC produced using the plasmid pZ169 as described above was brought to a final concentration of 8M urea (total volume 0.2-0.3 mls.). A palmitylation solution (PI₂O/TEA) was then prepared by adding palmitic anhydride to triethylamine to give a final concentration of palmitic anhydride of 20 mg/ml of triethylamine.

Approximately 10 μ l of PI₂O/TEA solution was added to 1 mg of recombinant canine ZPC in 8M urea (described above). The mixture was allowed to stand at room temperature for a least two hours after which the preparation was ready for mixture with GMDP/oil adjuvant.

Chitosan modification is another useful modification of canine ZPC for the practice of the present invention. Briefly, 1.5 ml of sterile mineral oil was added to 1.5 ml of recombinant canine ZPC solution prepared as described above using the plasmid pZ169 (2 mg/ml ZPC, 3 mg total is 8M urea) was mixed with 5 drops of Arlacel A (mannide monooleate, Sigma, St. Louis, MO). Subsequently, 0.75 ml of Chitosan (2% wt/vol. is 0.5M sodium acetate, pH 5.0) was added, and the mixture was sonicated for 10-20 seconds, followed by the addition of 0.045 ml of 50% NaOH and another round of sonication for 10-20 seconds. Finally, 10 μ l of 10 mg/ml GMDP/8M urea was added.

A group of three dogs was immunized five times each at one-month intervals with subcutaneous injections of 1 mg doses of the N-terminal canine ZPC modified by the addition of chitosan prepared as described above. Immunized dogs developed antibody titers of 1:8000-1:16000 against heat solubilized dog zona pellucida (self-titers) using methods

- 65 -

described above. The estrus cycle of the dogs showing self-titers was anovulatory and prolonged (4-6 weeks instead of the normal 10-day to 14-day cycle for normal dogs). Of the three immunized dogs, two have experienced their first estrus; one of the two dogs exhibited estrus six months after the first immunization and was bred and found to be infertile. The second of the two dogs experienced estrus and remained infertile nine months after the first immunization. The third dog has yet to experience estrus more than nine months after immunization.

Another group of four dogs were immunized three times at one-month intervals using 1 mg doses of palmitylated canine ZPC (prepared as described above) in GMDP/oil adjuvant administered subcutaneously. These animals achieved self-titers (against heat solubilized dog zona pellucida) of 1:4000-1:8000. Nearly seven months after immunization, two of the four dogs experienced estrus and remain infertile. The remaining two dogs have yet to experience estrus.

Another set of dogs was immunized 3 times at one-month intervals, using subcutaneous injections of 1 mg of recombinant canine ZPC produced using pZ166, (a plasmid similar to pZ169 but containing a DNA sequence encoding amino acids 23-379 of the canine ZPC protein) in GMDP/oil adjuvant. These animals failed to develop self-titers and became pregnant after breeding. Similarly, dogs immunized with canine ZPC fragments produced using the baculovirus system failed to induce infertility.

Example 19

Vaccination of Cows and Cats with Recombinant Zona Pellucida Proteins

Preliminary studies were undertaken to assess the ability of recombinant zona pellucida proteins to induce infertility in cows and cats.

- 66 -

Cows were injected with 3 or more doses (in GMDP (250 μ g) oil adjuvant) of 1 mg of a variety of recombinantly derived ZPC proteins from canine and porcine sources including canine ZPC produced using the plasmid pZ169 as shown in Figure 5. Recombinant proteins were administered in an unmodified form and in palmitylated and chitosan modified forms. None of the ZP protein preparations induced self-titers or infertility in the vaccinated cows. Further studies are underway using different recombinant preparations of zona pellucida proteins and differing dosage regimens in attempts to induce self-titers and infertility in cows.

Similarly, cats were vaccinated with the following recombinant zona pellucida proteins: a mixture of recombinant feline ZPA, ZPB, and ZPC; porcine ZPC produced using pZ156 as described above and shown in Figure 3; and canine ZPC produced using the plasmid pZ169 described above and shown in Figure 5. Cats vaccinated using these ZP protein preparations produced antibody to the vaccine proteins, but produced no self-titers and were consequently fertile. Studies are ongoing to determine the effects of modifying the recombinant zona pellucida proteins in attempts to stimulate the production of self-titers and to induce infertility.

Studies are also ongoing to select other recombinantly derived zona pellucida protein fragments for testing as possible immunocontraceptives.

Numerous modifications in variations in the practice of the invention as illustrated in the above examples are expected to occur to those of ordinary skill in the art. Consequently, the illustrative examples are not intended to limit the scope of the invention as set out in the appended claims.

WE CLAIM:

1. A method for inducing reproducible transient infertility in a mammal which comprises administering to a subject mammal a dose of a zona pellucida protein or fragment thereof, said proteins being selected from
5 the group consisting of mammalian ZPA, mammalian ZPB, and combinations thereof, effective to stimulate production in said mammal of antibodies which recognize ZPA or ZPB protein of said mammal.
2. The method of claim 1, wherein said mammalian ZPA and ZPB are derived from the same mammalian species as the subject
10 mammal.
3. The method of claim 1 wherein said mammalian ZPA and ZPB are derived from a mammalian species other than the subject mammal.
4. The method of claim 1, wherein said mammalian ZPA or
15 ZPB protein is selected from the group consisting of porcine, canine, feline, bovine, cynomolgus monkey, and human ZPA and ZPB.
5. The method of claim 1 wherein said mammalian ZPA and mammalian ZPB are essentially devoid of ZPC.
6. The method of claim 1 wherein said zona pellucida
20 protein is substantially only ZPA.
7. The method of claim 1 wherein said zona pellucida protein is substantially only ZPB.

1 4 0

8. The method of claim 1 wherein said mammalian ZPA and ZPB is recombinant ZPA and ZPB.

9. The method of claim 1 wherein said antibodies have a titer of at least 1:250.

5 10. A method for inducing permanent sterility in a mammal which comprises administering to a subject mammal a dose of a recombinant mammalian ZPC protein or fragment thereof, effective to stimulate production in said mammal of antibodies which recognize the ZPC protein of said mammal.

10 11. The method of claim 10, wherein said mammalian ZPC protein is derived from the same species as the subject mammal.

12. The method of claim 10 wherein said ZPC is derived from a mammalian species other than the subject mammal.

15 13. The method of claim 10, wherein said mammalian ZPC protein is selected from the group consisting of porcine, rabbit, canine, feline, cynomolgus monkey, and bovine ZPC.

14. The method of claim 10 wherein said ZPC protein is essentially devoid of ZPA and ZPB.

20 15. A pharmaceutical composition comprising, an effective contraceptive dose of a recombinant ZPC protein or an immunocontraceptively active fragment thereof.

1 4 1

16. A pharmaceutical composition comprising an effective contraceptive dose of a zona pellucida protein selected from the group consisting of mammalian ZPA and ZPB, and fragments thereof, and pharmaceutically acceptable carriers, diluents and adjuvants.

5 17. The pharmaceutical composition of claim 16 wherein said mammalian ZPA and ZPB are derived from the same mammalian species as the subject mammal.

10 18. The pharmaceutical composition of claim 16, wherein said mammalian ZPA and ZPB are selected from the group consisting of porcine, feline, canine, bovine, cynomolgus monkey, and human ZPA and ZPB.

19. The pharmaceutical composition of claim 16 wherein said mammalian ZPA and ZPB are essentially devoid of ZPC.

15 20. The pharmaceutical composition of claim 16, wherein said mammalian ZPA and ZPB is recombinant ZPA and ZPB.

21. A purified and isolated DNA sequence encoding porcine ZPA, ZPB, ZPC, or immunocontraceptively active fragments thereof, said DNA sequences being essentially as set out in SEQ ID NOS. 1, 3, and 5.

20 22. A purified and isolated DNA sequence encoding rabbit ZPC or an immunocontraceptively active fragment thereof, said DNA sequences being essentially as set out in SEQ ID NO. 7.

1 4 2

23. A purified and isolated DNA sequence encoding canine ZPA or ZPC, or immunocontraceptively active fragments thereof, said DNA sequences being essentially as set out in SEQ ID NOS. 9 and 11.

24. A purified and isolated DNA sequence encoding feline ZPA, ZPB, or ZPC, or immunocontraceptively active fragments thereof, said DNA sequences being essentially as set out in SEQ ID NOS. 13, 15, and 17.

25. A purified and isolated DNA sequence encoding bovine ZPA, ZPB, or ZPC, or immunocontraceptively active fragments thereof, said DNA sequences being essentially as set out in SEQ ID NOS. 19, 21, and 23.

26. A purified and isolated DNA encoding human ZPA or immunocontraceptively active fragments thereof, comprising DNA present in the human DNA inserts in lambda phage clones A1 (ATCC No. 75404) and A4 (ATCC No. 75403).

27. A purified and isolated DNA encoding human ZPA or an immunocontraceptively active fragment thereof, said sequence being essentially as set out as SEQ ID NO. 42.

28. A purified isolated DNA encoding human ZPB or immunocontraceptively active fragments thereof, comprising human DNA present in the DNA inserts in lambda phage clones 1-1 (ATCC No. 75406) and 4-9 (ATCC No. 75405).

29. A purified and isolated DNA encoding human ZPB or an immunocontraceptively active fragments thereof, said sequence being essentially as set out in SEQ ID NO. 40.

30. A vector containing the DNA sequence of claim 21.
31. A vector containing the DNA sequence of claim 22.
32. A vector containing the DNA sequence of claim 23.
33. A vector containing the DNA sequence of claim 24.
- 5 34. A vector containing the DNA sequence of claim 25.
35. A vector containing the DNA sequence claim 26.
36. A vector containing the DNA sequence of claim 27.
37. A vector containing the DNA sequence of claim 28.
38. A vector containing the DNA sequence of claim 29.
- 10 39. A procaryotic or eucaryotic host cell stably transformed or transfected with a vector according to claims 30, 31, 32, 33, 34, 35, 36, 37, or 38.
- 15 40. A polypeptide product of the expression in a procaryotic or eucaryotic host cell of a DNA sequence according to claims 21, 22, 23, 24, 25, 26, 27, 28 or 29.
41. A process for the production of a recombinant mammalian zona pellucida protein or fragment thereof, said process comprising:

growing, under suitable nutrient conditions, procaryotic or eucaryotic host cells transformed or transfected with a DNA vector according to claims 30, 31, 32, 33, 34, 35, 36, or 37 and isolating desired polypeptide products of the expression of DNA sequences in said vector.

5 42. A method for inducing reproducible transient infertility in a mammal, the method comprising, administering to a subject mammal a contraceptively effective dose of an antibody directed to a zona pellucida protein, said antibody selected from the group consisting of anti-ZPA antibodies and anti-ZPB antibodies.

10 43. A method for inducing permanent sterility in a mammal, the method comprising administering to a subject mammal a contraceptively effective dose of an antibody directed to ZPC.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US93/10851

BOX II. OBSERVATIONS WHERE UNITY OF INVENTION WAS LACKING

This ISA found multiple inventions as follows:

- I. Claims 1-9, 16-20, 40 and 42 drawn to a method of inducing transient infertility and pharmaceutical compositions comprising ZPA or ZPB proteins, classified in Class 424, subclass 88 and 85.8.
- II. Claims 10-15, 40 and 43 drawn to a method of inducing permanent sterility and pharmaceutical compositions with ZPC proteins, classified in Class 424, subclass 88 and 85.8.
- III. Claims 21-39 and 41, drawn to DNA and expression vectors for zona pellucida proteins and a process of producing recombinant proteins, classified in Class 435, subclasses 69.1 and 69.3, 320.1 and Class 536, subclasses 22.1 and 23.5.

The inventions listed as Groups I/II/III do not meet the requirements for Unity of Invention for the following reasons:

Group I is drawn to a first product and a first method of use, Group II is drawn to second product and a second method of use; and Group III is drawn to a third product. PCT Rule 13 does not provide for multiple products or methods within a single application. These inventions require different ingredients and process steps to accomplish the use of ZPA-, ZPB-, ZPC-specific proteins and ZPA-, ZPB-, ZPC-specific antibodies. Proteins (pharmaceutical compositions) and DNA (and its vectors) are distinct because their structures and modes of action are different. Furthermore, this application contains claims directed to the following patentably distinct species of the claimed inventions I, II and III: wherein the zona pellucida protein specificity is (a) ZPA, (b) ZPB or (c) ZPC. These species are distinct because their structures and modes of action are different; the substitution of one for another would not lead to the same effects.
